# DAMPIER ARCHIPELAGO FLORA SURVEY - 1987

## SECTION 1

### INTRODUCTION

#### 1.1 SCOPE OF WORK

This study was instigated by the Pilbara Region of the Department of Conservation and Land Management to provide an updated and more extensive list of plant species than was presently available for the islands of the Dampier Archipelago.

The work was to involve;

- (i) field identification of the plant species when this could be confidently done by the author;
- (ii) collection of species not known by the author when flowers or seeds were present;
- (iii) herbarium identification as required;
- (iv) the creation of species lists and other data in the form of a report.

Due to limitations of time, transport and finance, only selected islands of the archipelago were to be surveyed. The report was to include various tables with species annotated to include descriptions of their associations, abundance, soil type and topography.

#### 1.2 METHODS

Transport to the islands was supplied by the Department of Conservation and Land Management (DCALM). The Department's island patrol vessel, "Yapurarra" was used for the purpose. The project co-ordinator, Mr. Keith Morris, planned the locations to be surveyed and arranged for vessel time as was appropriate. The author was taken to a predetermined location on an island, given a specific time allowance, and collected at either the same point or a different location along the coast. In this manner, large areas of land could be surveyed within the limited amount of time available.

Eight of the largest islands in the archipelago were selected for the survey. These were Enderby, Malus, Rosemary, Angel, Eaglehawk, West Lewis, East Lewis and Delambre Islands. Dolphin Island was deliberately excluded as it has been surveyed previously (Blackwell 1978). The time spent on each island is listed in Section 6.1, and areas surveyed can be seen by referring to Section 7, Map 2.

A standard form for recording information was used, a sample of which is in the Appendix. (See Section 6.4) Plant species identified were recorded on the form together with their abundance, associations and other influencing factors. Plants which could not be identified and which were not sterile were (with some unusual exceptions) collected for later identification in the Pilbara Regional Herbarium, Karratha. Species which could not be identified by the author were sent to the WA Herbarium, Perth, or to other specialist taxonomists in the eastern states. Results were compiled into a data base using the program "PFS First Choice" with an IBM PC XT computer. The tables included in this report were produced using this program.

### 1.3 LIMITATIONS

Various factors combined to limit the species found during this survey. These factors are as follows.

#### 1. Time Limits

The time allowed for this report required identification and collection to be done in the period August to November 1987. Limitations on the author's own time and boat availability meant that only a few hours could be spent on some of the very large islands. (Example, East Lewis 3 hours, West Lewis 5 hours - see Section 6.1.) This reduced the area of coverage significantly and consequent completion status of the lists.

#### 2. Seasonal Limitations

Visits to most of the islands occurred late in the season. By this time plants had finished their flowering and seeds had fallen, making identification of species not readily recognised by the author virtually impossible. This was especially so in the case of grasses. Seasonal limitations have also reduced the plant species recognised substantially.

#### 3. Data Base

Unbeknown to the author, the program used for the data base does not alphabetically arrange the second word of an entry. Thus, while genera are arranged alphabetically, their corresponding species are sorted only on an "as-found" basis. This limitation was not addressed in the User's Manual and was discovered too late to effect a change. As a result, plant families and genera are arranged alphabetically but species within a genus are listed randomly.

#### 1.4 FORMAT OF THE REPORT

The results of the survey are contained in a series of tables in Section 7 of this report. The basic tables produced are:

Table 1	Archipelago Complete Species List
Table 2	Species List Arranged By Island
Table 3	Species List Arranged By Association
Table 4	Species List Arranged By Abundance
Table 5	Field Ecological Notes
Table 6	Complete List Of All Records Made

Notes on the definitions used, on the identification process and recommended future activities are included in the following sections.

## SECTION 2

### DEFINITIONS

#### 2.1 INTRODUCTION

Plant lists, (Tables 1,2,5 & 6) are compiled by family according to Green (1985). Within the family, the plants are listed alphabetically under genus, but due to limitations of the computer data base used, species are not alphabetically listed but come on an "as found" basis.

Tables 3 and 4 are presented according to Association and Abundance respectively. Again, they are listed under family number and alphabetically under genus.

Plant association categories are described in Section 2.2 and are similar to those used by Burbidge and Prince (1977) and Morris (1988).

Four Abundance categories were used by the author and are described in Section 2.3.

Topography and Soil Type were both given subjective descriptions by the author and are not based on any in depth knowledge of geographical or geological features. These are described in sections 2.4 and 2.5 respectively.

#### 2.2 VEGETATION ASSOCIATIONS

Seven vegetation associations have been used in this report. These include the six associations used by Morris (1988), (Littoral, Sandplain, Run-On and Flats, Drainage-Line, Rocky Slope and Rock Pile/Outcrop), as well as one further association, Beach. This was included to account for the vegetation between the shoreline and inland sandplain. Table 3 shows the flora list for each association.

##### 2.2.1 LITTORAL ASSOCIATION

This association includes:

(a) Mangal community which occurs in narrow bands in sheltered bays or tidal creeks. Avicennia marina is the dominant species with frequent Rhizophora stylosa.

(b) Halophytic community of which Haloscarcia spp. dominate with the grass Sporobolus virginicus. Halophytes Sclerolaena diacantha, Neobassia astrocarpa and Synaptantha tillaceae are frequent.

### 2.2.2 BEACH ASSOCIATION

This includes dominant species found on;

(a) beach (b) foredunes (c) hind dunes.

The soil is sandy as described in each instance.

#### (a) BEACH

On white beach sand Spinifex longifolius is dominant along the flat beach zone, with frequent Salsola kali and occasional Ipomoea pes-caprae. The annuals Synaptantha tillaceae, Clianthus formosus and ephemeral Ptilotus villosiflorus also occur.

#### (b) FOREDUNE

This is generally white beach sand with fine to medium grade shell-grit. The low shrub, Acacia bivenosa, with dwarf shrubs Scaevola crassifolia and Scaevola cunninghamii are frequent with occasional Atriplex isatidea, over Salsola kali. The grass Spinifex longifolius, is dominant with frequent Eulalia fulva and Paspalidium sp. Frequent creepers include Ipomoea pes-caprae and Canavalia rosea, as well as the annual Clianthus formosus. The ephemeral Ptilotus villosiflorus is frequent with occasional Euphorbia coghlani, E. australis, E. tannensis and Goodenia microptera.

#### (c) HIND DUNE

Sands vary from white beach sand with shell-grit, pinkish sandy soil to grey sands. Shrubs of Acacia bivenosa, A. coriacea, Rhagodia eremaea, R. preissii are all frequent, with occasional Heterodendrum oleaefolium and Pittosporum phylliraeoides. These grow over frequent Threlkeldia diffusa, Salsola kali, Adriana tomentosa and annuals Swainsona pterostylis, Cleome viscosa, Boerhavia sp. with Euphorbia tannensis. Grasses Eulalia fulva and Paspalidium sp. are frequent with occasional Triodia pungens. Creepers Commicarpus australis and Canavalia rosea are frequent.

### 2.2.3 SANDPLAIN ASSOCIATION

Sandplain associations are often found adjacent to Beach associations, others are found further inland. They are described in the tables according to landform, i.e. flat sandplain (FSP), depressed sandplain (DSP) etc. Soils range from whitish-grey sand, grey-brown sand, pinkish sand to reddish brown sand.

These areas are usually dominated by the grass Triodia pungens with occasional Triodia spp. and frequent Eulalia fulva, Enneopogon pallidus with occasional

Eragrostis eriopoda. Upper level species include frequent shrubs Acacia bivenosa, Rhagodia eremaea, R. preissii and Myoporum acuminatum with occasional Acacia coriacea and A. pyrifolia. The mid level species include frequent Sarcostemma australe and the annual Trichodesma zeylanicum. Lower level species are dominated by the frequent annuals Ptilotus exaltatus, Indigofera monophylla, Euphorbia coghlani, E. tannensis, with occasional Halosarcia spp., Salsola kali, Threlkeldia diffusa, with annuals Ptilotus obovatus, Cleome viscosa, Swainsona pterostylis, Pterocaulon sphacelatum, and P. sphaeranthoides.

#### 2.2.4 RUN-ON ASSOCIATION

Run-On areas are low lying, with fine soils which become waterlogged after rain. These areas again are described according to landform and location. The topography of those near to the coast (but far enough inland not to be included in Littoral Association), is described as tidal mud flats, whilst others are described as swampy run-on, depressed run-on etc.

Vegetation is sparse, the most frequent species being Rhagodia eremaea, with occasional shrubs Acacia bivenosa, Acacia orthocarpa and Sesbania cannabina. Beneath these the annuals Trichodesma zeylanicum and Ptilotus exaltatus are frequent, with Adriana tomentosa and Halosarcia spp. Occasional species include Alysicarpus rugosus, Swainsona pterostylis, Flaveria australasica, with Cynanchum floribundum. Tribulus occidentalis is frequent as is climber Mukia maderaspatana, Triodia pungens and Triodia spp., with Eragrostis eriopoda are frequent, with Eulalia fulva, Panicum decompositum and Sporobolus virginicus in the damper areas.

#### 2.2.5 DRAINLINE ASSOCIATION

Drainage lines occur between rocky slopes and include inland creekbeds. Grey sand soil with pebble overlay is the common soil type and supports a diverse range of vegetation and flora. Eucalyptus microtheca, E. terminalis and Terminalia canescens grow to 4m, over shrubs Sesbania cannabina, Sarcostemma australe and occasional Acacia pyrifolia. Triodia angusta is the dominant grass species with occasional Cymbopogon ambiguus. In water holding areas, Cyperus cunninghamii and C. vaginatus are found. Indigofera trita and Indigofera linifolia are frequent, with Triumfetta appendiculata, Flaveria australasica and Rhynchosia minima.

#### 2.2.6 ROCKY SLOPE ASSOCIATION

Rocky slope associations grow in red pebbly soil or red clay with a stony overlay. The vegetation consists of low shrubs, frequent Acacia pyrifolia, Grevillea pyramidalis and Hakea suberea, with occasional Ficus opposita. Lower bushes include occasional Capparis spinosa, Acacia orthocarpa, Stylobasium spathulatum, Pittosporum phylliraeoides and Wrightia cunninghami. Annuals Trichodesma zeylanicum, Trachymene oleracea, Pterocaulon sphacelatum and Streptaglossa decurrens are frequent. Below these, Evolvulus alsinoides, and Mollugo molluginis are frequent, with occasional annuals

Gomphrena cunninghamii, Ptilotus fusiformis, Cleome viscosa, Tephrosia rosea, Tephrosia eriocarpa, Melhania oblongifolia and Oldenlandia crouchiana. Spreading ground cover Solanum horridum is frequent, with creepers Rhynchosia minima, Mukia maderaspatana.

#### 2.2.7 ROCKY OUTCROP ASSOCIATION

Where red soil has accumulated between rock piles and outcrops vegetation grows. Species include Ficus opposita, Ficus platypoda, Ficus virens, Pittosporum phylliraeoides, Capparis spinosa, with occasional Flueggea virosa, Phyllanthus ciccoides, Brachychiton australe and Myoporum acuminatum. The grass Themeda australis is found frequently with occasional Cymbopogon ambiguus and Sorghum plumosum. Creepers Canavalia rosea, Tinospora smilacina, Convolvulus grubscens, Operculina brownii, Mukia maderaspatana and Trichosanthes cucumerina are all found occasionally growing over rocks or vegetation.

#### 2.3 ABUNDANCE OF PLANTS

Table 4 lists plant species by abundance. In describing the abundance of species, four categories were used, these being; dominant (meaning that the species dominated by its prevalence, not its height or size), frequent, occasional and rare.

A subjective value was given to each species according to its abundance in each particular location where it was recorded. For example, Acacia bivenosa may have been recorded as "frequent" along the foredunes of a particular island, and as "rare" on the rocky slopes of that island, where only one or two shrubs were seen.

Overall abundance of a species can also be determined from Table 4. For example, Scaevola amblyanthera is noted as being "occasional" at Location C on Malus. This refers to its abundance at that location only. However, this species is not found elsewhere on Malus, nor on any other island, therefore, it would have to be classified as a "rare" species overall.

#### 2.4 TOPOGRAPHY

Topography is described in simplistic terms, intended merely to give a brief description of the landforms of each area. Descriptions cover large areas. All notable changes to landforms were recorded, however, and the many topographical descriptions are listed below:

B = Beach (meaning the flat, white sandy beach area)  
BCB = Bank of Creek-bed  
CB = Creekbed  
DSP = Depressed Sandplain (meaning a large low lying sandy area)  
DRO = Depressed Run-On Area (very low lying run-on area)  
FD = Foredune  
FSP = Flat Sandplain  
G = Gully  
GB = Gravel Beach  
HD = Hind Dune  
LABS = Low Area between two Slopes (usually drainline)  
TC = Tidal Creek  
TMF = Tidal Mud Flat  
USP = Undulating Sandplain  
RB = Rocky Beach  
RD = Rocky Depression (usually drainline)  
RP = Rocky Plateau  
RO = Rock Outcrop  
RS = Rocky Slope  
SM = Salt Marsh  
SS = Slight Slope  
SRO = Swampy Run-On Area  
SRS = Steep Rocky Slope

## 2.5 SOIL TYPES

Soil types have been simply classified by appearance into four major categories. These are, sands, soils, clays and rocks. Colour and readily observable features such as the presence of shell-grit or pebbles have been included in descriptions. No quantitative analysis has been done to scientifically categorise the soils however.

The types identified, and abbreviations used in the Tables are as follows:

BG = Beach Gravel  
BR = Black Rock  
BSS = Brown Sandy Soil  
FGS = Fine Grey Soil (very fine clay-like soil)  
GS = Grey Soil  
GBS = Greyish-brown soil  
GCM = Grey clay mud (as found in littoral areas)  
GSS = Grey Sand with Shell-grit (FD & HD)  
GMBR = Grey mud and Black Rocks (as found in littoral areas)  
GSSP = Grey Sandy Soil with Pebbles (often on hind dunes)  
PS = Pinkish sand  
PSS = Pinkish sand with shell-grit (FD & HD)  
RR = Red Rocks  
RCG = Red Clay and Gravel  
RGR = Red and Green Rock  
RPR = Red Pebbles with Rocks  
RSSR = Red Sandy Soil with Rocks  
RRLS = Red Rock with Limestone  
WBS = White Beach Sand (fine grade as found on beach)  
WBSS = White Beach Sand with Shell-grit (HD)  
WGSS = Whitish-grey Sandy Soil (HD & FD)

SECTION 3

BOTANICAL NOTES

Notes on the status of introduced species, new species, species needing redefinition and undefinable species found during this survey are presented below. Notes on some other species are also included.

3.1 INTRODUCED SPECIES

(1) Aerva javanica (Kapok Bush)

This was the most commonly found introduced species, being recorded on Angel, West Lewis, East Lewis, Malus and Enderby Islands.

Eradication of this species on Enderby Island would be possible if swift action was taken as only isolated bushes were found. At the time of the survey, these plants on Enderby were removed, but locations should be checked as it is most probable that seeds in the surrounding soil will have already germinated.

On the other islands, the species was usually found spread over larger areas. In most cases, however, careful removal of plants and some topsoil in the area could prevent further spreading of the species.

(2) Cenchrus ciliaris (Buffel Grass)

This introduced grass was found to be widespread on East and West Lewis Islands and on Rosemary Island.

(3) Opuntia stricta (Prickly Pear)

Prickly Pear was found on West Lewis Island and has been previously recorded on East Lewis Island.

Cochineal was introduced to the plants in November 1986 to control this pest and a large portion of the plants have now died.

(4) Tamarix aphylla (Tamarisk)

A large tree has been planted at the shack on Rosemary Island.

(5) Cocos nucifera and Phoenix dactylifera (Palm Trees)

Trees of each species have been planted at the shack on Rosemary Island. These may have potential for spreading.

(6) Ixiochlamys cuneifolia (Ref. Kar No. 03124)

This is not an introduced species to the region, but it was found nowhere else on the islands except on a rare occurrence near the shacks on Malus. Therefore the author suggests it may be an introduced species to the islands.

### 3.2 NEW SPECIES

(1) Heliotropium sp.nov. (Ref. KAR NO. 03099)

This Heliotropium was collected from Eaglehawk Island in a very dry condition. The author recognised it as being slightly different from the more common species in the area, Heliotropium ovalifolium, but was unable to identify it further. Consequently, it was sent to Mr. Bob Lewis, of the CSIRO in Canberra, who is currently researching the Heliotropium genus (with the view to using it as a control for the weed Paterson's Curse). Mr. Lewis was also somewhat puzzled by the specimen and passed it on to Dr. Lyn Craven, Herbarium Australiense, Canberra, who is currently preparing the Boraginaceae section for Flora Of Australia. The author was informed that, until flowers and seeds could be collected from this plant, a description could not be made, and therefore it should simply be described in this report as Heliotropium sp.nov. with the added comment "glandular sp. aff. H. ovalifolium." Obviously, a further collection needs to be made as soon as possible. (It would be valuable to have the plant described for the relevant section in Flora Of Australia.)

### 3.3 SPECIES NEEDING REDEFINITION

(1) Heliotropium tenuifolium (Ref. KAR NO. 03098)

Specimens of Heliotropium tenuifolium and H. paniculatum in the Pilbara Regional Herbarium did not clearly show the differences between these two species. Only a very brief reference to these species could be found (G. Craig 1983) and this was inadequate for the purpose. Therefore, the opportunity was taken to send the specimen to Mr. Bob Lewis at CSIRO, Canberra, who passed it on to Dr. Lyn Craven, Herbarium Australiense, Canberra. The author was informed that this specimen should be described in this report as one of the H. tenuifolium complex", as further work needs to be done on this species and divisions made.

This species was found on almost every island surveyed. However, it has only been referred to as "H. tenuifolium complex" in the instance where the specimen was actually described so by Dr. Craven. Elsewhere it is merely described as H. tenuifolium.

(2) Scaevola amblyanthera (Ref. KAR NO. 03127)

On Malus Island, the author collected a *Scaevola* she was not familiar with. This specimen she sent off to Professor Roger Carolin, at the University of Sydney. He replied that for this report, the specimen should be described as *Scaevola amblyanthera*. Although previously described by F. Mueller, this species is not listed in Greens (1985) as a Western Australian species. When the author questioned Prof. Carolin about this, he reported that it is a species usually only found in the interior of Australia. The specimen sent to him from Malus Island has close affinities with the interior species, but further taxonomic work is required. Prof. Carolin was not aware of any other island records of this species.

(3) Scaevola cunninghamii (Ref. KAR NO. 03118)

This species had previously been collected from Varanus Island, Lowendal Group, by the author in its glabrous form. Therefore, when found in pubescent form on the Dampier Archipelago islands, the author was unsure of correct identification. However, Prof. Roger Carolin, University of Sydney, confirmed that both types of species are at present being referred to as *Scaevola cunninghamii*, although one is quite glabrous and the other pubescent. (For comparison refer to Varanus Island specimen KAR NOs. 02797, 03028/9). Prof. Carolin comments that "Bentham separates them as *var. hirsuta*, but there appears to be a complete gradation".

(4) Olearia axillaris cens.lat. (Ref. KAR NO. 03088)

Specimens of this bush had not previously been lodged in the Pilbara Regional Herbarium. Specimens collected during the survey were sent to Mr. Nicholas Lander, W.A. Herbarium, Perth, for confirmation of identification as reference material was not adequate.

Mr. Lander informed the author that for this report the plant should be referred to as *Olearia axillaris cens.lat.* (in the general sense). He confirmed that it does differ from the species described as *Olearia axillaris*. Mr. Lander is currently working on the Asteraceae section of Flora Of Australia, and hopes to do further work on the Dampier Archipelago specimens. He suggests that it may ultimately be called *Olearia damperii*.

### 3.4 UNDEFINABLE SPECIES

(1) Paspalidium sp.

The *Paspalidium sp.* referred to in this report was found on the fore and hind dunes on every island surveyed. One tiny remnant of seedhead found (Malus Island) was used to try to get an identification of genus. From this very inadequate remnant, the author identified the grass as a *Paspalidium*, but the overall appearance of the grass does not match any of the *Paspalidium spp.* described in available texts.

It is most similar to P. tabulatum but the differences are too many to describe it as that. The author is of the belief that this Paspalidium is the same one referred to in Blackwell et.al (1978), as being thought to be an undescribed species. (Section 4 2c pg 49 and Section 8, 8.2) Obviously this grass needs to be collected as soon as possible when fertile.

(2) Triodia spp.

Except for Triodia pungens, the author was, in most cases, not prepared to name species. Close examination of the lemma is the only positive means of identification of this species, and this was not possible. Only in a minority of cases, where a particular habitat and general description of the grass seemed obvious, was the author confident enough to name the species (eg. Triodia angusta, along creeklines under Eucalypts on Enderby).

Triodia spp. need to be collected from all locations when fertile and examined in detail for positive identification.

(3) Scaevola aff. spinescens (Ref. KAR NO. 03170)

The bush I have referred to as Scaevola aff. spinescens was found commonly on all islands. Foliage on the sterile specimens collected by the author match those recently collected from the mainland by Mrs. K. Glennon and lodged in the Pilbara Regional Herbarium (Ref. Kar. No. 03146) as Scaevola aff. spinescens.

(4) Boerhavia spp.

Until recently most Boerhavias were listed under the species Boerhavia diffusa. Despite the fact that they have been split into numerous species for some time now, the Pilbara Regional Herbarium still has them filed under Boerhavia diffusa. This is a confusing genus and it is impossible to identify them without flowers and/or seeds. Therefore, with the one exception of Boerhavia repleta with which the author is familiar, identification has not been possible. When in flower, these species need to be collected and identified.

### 3.6 GENERAL NOTES

(1) Wrightia cunninghamii (Ref. KAR NO. 03132) and Wrightia saligna (Ref. KAR NO. 03167)

This genus was not found anywhere in flower or seed; hence leaf, general habit and habitat were the only means of identification. A sterile specimen of Kar. No. 03132 was sent to the WA Herbarium in Perth, and sent back identified as Wrightia saligna. However, in subsequent weeks, at the author's request, a photocopied description of the genus was received. This material included a description of both Wrightia cunninghamii and Wrightia saligna as found in Bentham and Mueller (1863) The author feels the description

of Wrightia cunninghamii more aptly fits specimen Kar No. 03132. To add to this, although the species had been very poorly collected when this volume was written (there are no specimens lodged in the Pilbara Regional Herbarium), it had at that time been collected from Enderby Island, Dampier Archipelago. Therefore the author feels confident enough to call the specimen Kar. No. 03132 Wrightia cunninghamii. The species was commonly seen on most islands surveyed. In later weeks, sterile specimen, Kar. No. 03167 was sent to the WA Herbarium, Perth, for a possible identification. This varied considerably to Kar. 03132 and better fitted the description of Wrightia saligna. The WA Herbarium confirmed that as far as they could tell, this identification was correct.

Obviously, both species need to be collected with flower and seeds for positive identification and for voucher files in both the Pilbara Regional and WA Herbariums.

(2) Santalum lanceolatum (Ref. KAR NO. 03169)

A sterile specimen was collected from Eaglehawk Island. The foliage resembled Santalum lanceolatum and the author sent the specimen to the WA Herbarium for further confirmation which was recently received.

This species needs to be collected with flowers/seeds for positive identification.

(3) Trachymene oleracea (Ref. KAR NO. 03139)  
and Trachymene didiscoides

The only description of these two species available, requested from the WA Herbarium, is in Latin. The specimens lodged in the Pilbara Regional Herbarium show no obvious differences between the two species. Identifications of plants collected were based on Trachymene oleracea, Kar. No. 03076, lodged by Mrs. K. Glennon. This specimen was thought to be the most reliable.

The author is in some doubt as to the validity of correct identification of the Trachymene didiscoides as recorded on the previous Dampier Archipelago Islands list. There are no specimens lodged from the islands to confirm correct identification, nor are references easily available unless one reads Latin.

(4) Chrysopogon fallax and Chrysopogon pallidus

Chrysopogon pallidus had been recorded previously as being on both Enderby and Rosemary Islands. There are no specimens lodged in the Pilbara Regional Herbarium to confirm this identification. The author is in doubt as to correct species identification. Chrysopogon fallax is the more common species in this area. C. pallidus is only very briefly referred to in Jessop (1981) as being a tropical species. Note that Chrysopogon fallax was not previously listed and perhaps there has been an identification error.

(5) Portulaca oleracea and Portulaca intraterranea

In the previous Dampier Archipelago Islands list Portulaca oleracea was regularly recorded. There was no record made of P. intraterranea which the author found in much more abundance. There are no island specimens lodged in the Pilbara Regional Herbarium and therefore past identification of these species is queried.

(6) Rhagodia eremaea (Ref. KAR NO. 03157)  
and Rhagodia preissii (Ref. KAR NO. 03158)

Rhagodia eremaea was not recorded on the previous Dampier Archipelago Islands list, however, both R. eremaea and R. preissii were found frequently on every island visited. Again, previous identifications are queried.

(7) Acacia bivenosa and Acacia pyrifolia

Both the above species were seen in their glaucous and non-glaucous habits. Due to time limitations, collections were not made, but it would be a valuable project in the future.

## SECTION 4

### COMPLETENESS OF SURVEY

#### 4.1 GENERAL

As stated in the Introduction of this report, the 1987 Dampier Archipelago flora survey was by no means comprehensive due to time and seasonal limitations. However, it has provided a complete list of species found on islands in the archipelago.

1. The eight islands visited in 1987 should be re-surveyed after both summer and winter rains. This would enable ephemeral species to be recorded and more grasses to be identified, neither of which were possible due to the unfavorable time of year during which the 1987 survey was carried out.
2. All Dampier Archipelago islands excluded from the 1987 study should be surveyed, except perhaps for Dolphin Island as it has been extensively covered by Blackwell (1978). However, outstanding work on the eight islands visited during the 1987 study, should be given first priority so as to complete the flora lists for those islands.

#### 4.2 ISLAND SURVEY AREAS

Of the eight islands visited, none were covered completely. Areas which are yet to be surveyed are as follows:-

Enderby Island : whole of centre of island generally from east to west. Coastal areas were well represented on Enderby but only one rocky area, on the NE end, was adequately surveyed. Ref. Map 3.1

Rosemary Island : northern end and extreme southern end need to be surveyed. Ref. Map 3.2

Malus Island : north-east end and extreme western end need to be surveyed. Ref. Map 3.3

West Lewis Island : All south-east side, centre of island, and south-west end. No Rocky Slope or Rock Outcrop areas were surveyed on this island. Ref. Map 3.3

East Lewis Island : Both north-west and south-west sides and centre of island. Ref. Map 3.3

Eaglehawk Island : eastern side needs to be surveyed. Ref. Map 3.4

Angel Island : All of northern half (coast and centre of island). Ref. Map 3.5

Delambre Island : Extreme north end needs to be surveyed. Ref. Map 3.6

Once these remaining areas are covered and the ephemerals and grasses recorded, the author is confident that the flora lists for these eight islands will be very near to complete.

#### 4.3 RECOMMENDED FOLLOW-UP WORK

In order to clarify the taxonomy of some species collected during this survey, it is recommended that the following are collected as soon as possible.

(1) Heliotropium sp.nov., collected on Eaglehawk Island needs to be collected with flower and seeds as soon as possible. Collections should be sent to:

- (a) Dr. Lyn Craven, Herbarium Australiense, Canberra.  
(Dr. Craven is currently working on the Boraginaceae family for Flora Of Australia.)

and to:

- (b) Mr. Bob Lewis, CSIRO, Division of Entomology, GPO Box 1700, Canberra, ACT 2601. (Mr. Lewis and his colleagues are experimenting with the Heliotropium genus in their work to control the weed Paterson's Curse.)

(2) Scaevola amblyanthera collected on Malus Island needs further collections made with flower and seeds. Collections should be sent to:

Professor Roger Carolin, The University of Sydney, School of Biological Sciences, Macleay Building A12, NSW 2006.

(3) Paspalidium sp. recorded on all islands visited needs to be collected with seedhead in order to have it identified and described.

(4) Triodia spp. need to be collected with seedhead for identification.

(5) Boerhavia spp. need to be collected when in flower and with seeds for identification.

(6) Wrightia cunninghamii (sterile specimen only collected) needs to be collected with flower and/or seeds for confirmation of its identification, and for herbarium voucher files.

- (7) Wrightia saligna (sterile specimen only collected) needs to be collected with flower and /or seeds for confirmation of identification and for and for herbarium voucher files.
- (8) Ventilago viminalis collected from Malus Island (sterile specimen only) needs to be collected with flower and/or seed for positive identification.
- (9) Scaevola aff. spinescens needs to be collected with flower and sent to:  
Professor Roger Carolin, address as above.
- (10) Santalum lanceolatum collected from Eaglehawk Island (sterile specimen only) needs to be collected with flower for positive identification.

## SECTION 5

### SUMMARY AND CONCLUSIONS

#### 5.1 RESULTS SUMMARY

A total of 288 species of plants from 60 families are known from islands in the Dampier Archipelago. This survey identified 47 more species than was previously known and 91 species recorded previously were not found during the survey. However, it should be remembered that previous totals represented the entire Archipelago.

The families Poaceae and Papilionaceae are well represented.

The table below summarises the number of plant species known for each of the eight islands surveyed.

Island	Total No. of Species now identified.	Previous No. of Species Known	New Species Identified	No. of Species Found by Author
Enderby	125	88	37	110
Malus	97	12	85	95
Angel	121	89	32	104
Eaglehawk	50	20	30	46
West Lewis	124	110	19	100
East Lewis	94	2	92	94
Rosemary	82	73	9	69
Delambre	45	8	37	45

## 5.2 CONCLUSIONS

The new, undescribed and undefinable species found in this survey indicate the need for more research and flora identification work on the islands of the Dampier Archipelago. The remoteness of the Pilbara, the relative isolation of the islands and the dearth of past research make the Archipelago an interesting and rewarding study area. The impact of tourism and recreational activities is beginning to become apparent, however, and it is essential that comprehensive studies into the existing flora be completed as soon as possible.

SECTION 6

APPENDICES

6.1 TIME SPENT ON ISLANDS

Actual time spent on each island (i.e. excluding travel time), is as follows.

ISLAND	DATE	HOURS	TOTAL HOURS
Enderby	14/08/87	6 hours	
	01/09/87	3 hours	
	02/09/87	7 hours	16 hours
Malus	26/08/87	5 hours	
	09/09/87	4 hours	9 hours
Angel	16/09/87	5 hours	5 hours
Eaglehawk	21/09/87	3 hours	3 hours
West Lewis	09/09/87	1 hour	
	06/11/87	4 hours	5 hours
East Lewis	09/11/87	3 hours	3 hours
Rosemary	10/11/87	4 hours	4 hours
Delambre	25/11/87	3 hours	3 hours
TOTAL TIME SPENT ON ISLANDS:			48 hours

6.2 NAME CHANGES OF SPECIES FROM PREVIOUS DAMPIER  
ARCHIPELAGO FLORA LIST

---

FAMILY	GENUS/SPECIES
031 Poaceae	<i>Chloris ruderalis</i> = <i>Chloris pumilio</i> R.Br.  <i>Panicum Cymbiforme</i> = <i>Whiteochloa cymbiformis</i> (Hughes) B.Simon  <i>Setaria carnei</i> = Not found in Green's Census
032 Cyperaceae	<i>Scirpus littoralis</i> = <i>Schoenoplectus littoralis</i> (Schrader) Palla
105 Chenopodiaceae	<i>Chenopodium rhadinostachyum</i> = <i>Dysphania rhadinostachya</i> (F.Muell)AJ Scott
165 Papilionaceae	<i>Canavalia maritima</i> = <i>Canavalia rosea</i> (SW) DC  <i>Crotalaria trifoliastrum</i> = <i>Crotalaria medicaginea</i> Lamk.  <i>Indigofera enneaphylla</i> = <i>Indigofera linnaei</i> S.Ali  <i>Indigofera viscosa</i> = <i>Indigofera colutea</i> (Burm.f.) Merr
185 Euphorbiaceae	<i>Phyllanthus baccatus</i> = <i>Phyllanthus ciccoides</i> F. Muell

### 6.3.2 ACKNOWLEDGEMENTS

I gratefully acknowledge help given in this survey by the following people.

Bruce Maslin, Paul Wilson, Nicholas Lander and Ray Cranfield, along with other members of the W.A. Herbarium staff for their help with identifications, and their encouragement.

Bob Lewis of CSIRO, Canberra, and Lyn Craven, Herbarium Australiense, Canberra for their help with identifications of the Heliotropium species.

Roger Carolin, University of Sydney, for his identifications of Scaevola and Goodenia species.

Kay Glennon for the use of her very reliable specimens lodged in the Pilbara Regional Herbarium

My husband Peter, for his help in creating the data base, for editing the work and for his constant encouragement.

Tony Start and Keith Morris (DCALM Karratha), Steve Vellacott (EPA Karratha) and Charles Nicholson (EPA Perth) for initiating the survey, for their guidance in report format, and for their help and encouragement, without which I would never have undertaken the project.

## 7.2 TABLES

### 7.2.1 LIST OF TABLES MADE

The list of Tables are as follows:-

TABLE 1 : Complete Species List For Surveyed Islands

TABLE 2 : Complete Species List By Island

- 2.1 Enderby Island
- 2.2 Malus Island
- 2.3 Angel Island
- 2.4 Eaglehawk Island
- 2.5 West Lewis Island
- 2.6 East Lewis Island
- 2.7 Rosemary Island
- 2.8 Delambre Island

TABLE 3 : List By Association

- 3.0 Littoral
- 3.1 Beach
- 3.2 Sandplain
- 3.3 Run-On
- 3.4 Drainline
- 3.5 Rocky Slope
- 3.6 Rock Outcrop

TABLE 4 : List By Abundance

- 4.1 Rare
- 4.2 Occasional
- 4.3 Frequent
- 4.4 Dominant

TABLE 5 : Species List With Ecological Comments

TABLE 6 : Complete List Of All Records Made

## 7.2.2 EXPLANATORY NOTES

### TABLE 1

Table 1 is a list of the species recorded on all eight islands surveyed. It lists Family, Species and Author and includes records from past surveys.

Where an '0' appears under the Record No. (REC NO) column, it indicates species that were found in the past but were not recorded this survey. This occurs especially with respect to the Poaceae and Cyperaceae Families as the 1987 survey was not carried out in the appropriate season for identification of those Families.

Where an 'X' appears under the Record No. column, it indicates species that were found this survey but were not previously recorded as being on the Archipelago islands.

'KAR NO' refers to the Karratha Number under which a species is lodged in the Pilbara Regional Herbarium. Where 'KAR NO' appears under the Record No. column, it indicates that a collection of the species was made and can be found in the Pilbara Regional Herbarium under that number.

Note that, in order to enter the Family Tamaricaceae into the program, it had to be given a Family Number. This Family is not listed in "Green's Census" and therefore has been given the fictional Family Number of 900.

Where a sign appears after a species name, it indicates a subspecies or variation of species. Unfortunately, this could not be accommodated in the Species column and therefore, the subspecies or variation appears only under Ecological Notes.

### TABLE 2

Table 2 gives a list of species found on each island individually. The Table includes all associations and locations in which a particular species was found. The author felt that this knowledge was of value in assessing the types of areas in which a species may be found.

### TABLE 3

Table 3 is a list of species found in each Association, on each island. Associations are explained in Section 2.2 of this report.

TABLE 4

Table 4 is a list of species found according to their abundance. The four categories and how they were arrived at is explained in Section 2.3 of this report.

TABLE 5

Ecological comments were made occasionally as species were recorded. These comments appear in Table 5. Included in this Table are subspecies and variations of species, as these could not be accommodated under the Species column of the report.

Abbreviations used in this Table are:

Dep.	= Depressed
Freq.	= Frequent
Gen.	= General
Nr.	= Near
Ref. KDM	= Species noted by Mr. Morris, in an area on Delambre Island, not surveyed by author.
V.	= very
£	= indicates a subspecies (ssp) or variety (var) of species.

TABLE 6

Table 6 is a complete print-out of all information collected during the survey except for Ecological notes.
