## FLORISTICS OF YELVERTON STATE FOREST

Yelverton Forest is an isolated block of State Forest, NW of Margaret River between Yallingup and Cowaramup. It is the only substantial block of uncleared land in this region. During November 1989, a brief survey was undertaken of the area to locate populations of *Johnsonia inconspicua* which was previously known only from its type locality (5 km south of Carbanup River). This population had subsequently been destroyed by the expanding tip and sand mine.

### Vegetation

The majority of the reserve is open Jarrah/Marri forest, ranging from tall to low in height depending on site. Sandy areas support a low woodland of *Agonis flexuosa* and *Allocasuarina fraserana*, or rarely a heath of *Pericalymma ellipticum*. Creeklines are edged with *Banksia littoralis* and *Callistachys lanceolata* over tall sedges. Along the edge of the railroad reserve a low dune supports a low open woodland of Banksia (*B. attenuata/B. illicifolia*) and *Allocasuarina fraserana*. This merges into the Jarrah/Marri woodland upslope. Opposite Poole Farm is a poorly drained flat dominated by *Homalospermum firmum* shrubland and to the north is a creekline with a low woodland of Bullrich (*Eucalyptus megacarpa*).

### Flora

Three hundred and eighty five species of vascular plant have been recorded from Yelverton Forest (10 are naturalized aliens). The majority of weeds are found in and around rubbish dumped along a track near the eastern boundary on Carter Rd and opposite Poole Farm. Efforts should be made to remove this rubbish and to clearly signpost these areas to ensure this practice ceases.

The flora is listed under families arranged alphabetically. Significant species are marked #. These include a population of *Caesia micrantha* which matches a undescribed species known only from Kalbarri to the Moore River. The largest known populations of *Johnsonia inconspicua* found along the railroad reserve on the eastern side of Yelverton Forest (in the Banksia low woodland). The populations of *Thysanotus glaucus* are the southernmost recorded and the only significant stands recorded in a reserve.

The *Actinotus* species recorded from the swamp opposite Poole Farm is the second known population of this species, previously known from north of Walpole. The record of *Platysace haplosciadia* (is either this or a new species) represents a range extension from Esperance.

Under Haemodoraceae the record of *Phlebocarya filifolia* represents the southernmost population (previous records Eneabba to Jandakot).

The record of *Gonocarpus simplex* (Haloragaceae) is the northernmost record, other collections are from Albany to Pemberton.

The record of *Logania aff. serpyllifolia* appears to be a previously unrecognized species. The herbarium contains two records of this taxon from the Busselton-Augusta area.

*Acacia inops* is a very restricted species, collections are known only from Yallingup and Margaret River. This is the only known record from CALM land.

*Calothamnus pallidiflorus* a species common on the Whicher Range, but with scattered records on the Blackwood Plateau towards Margaret River is here at the western margin of its range. This population is a significant range extension.

Two *Pultenaea* species (*P. drummondii* and *P. pinifolia*) recorded, are both Busselton-Augusta endemics. While both are well represented on CALM lands on the Blackwood Plateau, both are probably at the western limits of their ranges at Yelverton.

*Persoonia saccata* is here at the southernmost limit of its range, as is *Opercularia echinocephala* (previously recorded as a Perth region endemic in the Perth Regional Flora, extending from Midland to Yarloop).

The *Tripterococcus* sp. may prove to be the species previously considered confined to the Scott Plains. This species has been sent to Adelaide for expert identification.

Given the very preliminary nature of these findings (note the large number of unidentified species) the flora contains a number of remarkable species. Further study will almost certainly increase this number.

The current listing of Yelverton as State Forest, given its isolated nature, small size and location as the major area containing *Johnsonia inconspicua* is somewhat anomalous. The Department should consider re-classifying this region as a nature reserve during the current review of land classification.

TABLE 1

FLORISTICS - Families are arranged alphabetically

Superscript \* = introduced

# = significant record

Postscript S = swamp

J = Jarrah woodland

B = Banksia woodland

D = Disturbed areas

J/B = Occurs both in Jarrah and Banksia woodland

FERNS

<i>Schizaea dichotoma</i>	S
<i>Lindsaea linearis</i>	J
<i>Pteridium esculentum</i>	J
<i>Selaginella gracillima</i>	S

GYMNOSPERMS

<i>Podocarpus drouyiana</i>	J
<i>Macrozamia riedleii</i>	J/B

FLOWERING PLANTS

AMARANTHACEAE

<i>Ptilotus stirlingii</i>	J
----------------------------	---

ANTHERICACEAE

<i>Agrostocrinum scabrum</i>	J
<i>Chaemascilla corymbosa</i>	J
<i>Burchardia umbellata</i>	J/B
<i>B. multiflora</i>	S
# <i>Caesia ?micrantha</i>	J
<i>C. occidentalis</i>	J
<i>Johnsonia acaulis</i>	B
# <i>J. inconspicua</i>	B
<i>Laxmannia ramosa</i>	B/S
# <i>Thysanotus glaucus</i>	B
<i>T. manglesianus</i>	J/B
<i>T. patersonii</i>	J/B
<i>T. multiflorus</i>	J
<i>T. triandrus</i>	J
<i>T. sp. 1</i>	B
<i>T. sp. 2</i>	J
<i>T. sp. 3</i>	J
<i>T. sp. 4</i>	J
<i>T. sp. 5</i>	S
<i>Tricoryne elatior</i>	J/B
