## SUMMARY

This data report presents the results of the first field survey of the *Ningaloo Marine Park Monitoring Program* (NMPMP) during May 1998. Twenty one sites were visited during this survey. Seven of these sites were located in sanctuary zones and the remaining 14 in general use zones. At each site a set of relocatable permanent monitoring transects were established. The selection of sites was influenced by historical information on backreef benthic communities from past surveys (Ayling *et al.* 1987; Forde 1994; Osborne in prep.). Reconnaissance of the Ningaloo Marine Park and proposed southern section was also carried out to identify human impacted sites and sites that are biologically unique. This reconnaissance will assist in the selection of future permanent monitoring sites.

The NMPMP was coordinated by the Marine Conservation Branch (MCB) of the Department of Conservation and Land Management (CALM) and conducted in collaboration with the Australian Institute of Marine Science (AIMS) and CALM's Pilbara Region and Exmouth District. This project was partially funded by the National Heritage Trust's Coast and Clean Seas, Coastal Monitoring Program.

The main objective of this survey was to establish a long-term monitoring program and provide baseline quantitative benthic habitat data along re-locatable transects to enable changes to the key conservation attributes of the Marine Park to be detected before unacceptable or irreversible impacts occur. Position-fixing of each transect was achieved by differential GPS to better than 3 m accuracy. High quality video footage was taken along three 50 m transects per site.

## ACKNOWLEDGEMENTS

### *Direction*

Director, Nature Conservation Division, CALM - Keiran McNamara  
Manager, Marine Conservation Branch (MCB), Nature Conservation Division, CALM - Dr. Chris Simpson  
Manager, Pilbara Region, CALM - Chris Muller

### *CALM Regional/District collaboration*

Pilbara Region - Fran Stanley, Reserves Management Officer.  
Exmouth District - Doug Myers, District Manager & Carolyn Williams, Conservation Officer Marine.  
Project Leader and Field Team Leader - Jennie Cary, MCB & Tim Daly (20-29) MCB.

### *AIMS collaboration*

WA Branch - Dr Andrew Heyward, Officer in Charge

### *Funding / Resources*

This project was partially funded by \$23 000 provided by the National Heritage Trust's Coast and Clean Seas Coastal Monitoring Program. Significant resources including scientific, technical and logistic support were provided by CALM.

#### Human Resources

CALM staff - 182 person days (142 - MCB, 40 - Regional)

CALM volunteers - 300 person days

AIMS staff - 40 person days

#### Equipment

CALM - Vehicle, vessel, photographic equipment, dive gear, trailers and other assorted field equipment.

AIMS - Vehicle, vessel, photographic equipment, satphone.

## 1 INTRODUCTION

### 1.1 General

This data report presents details of the first field survey of the *Ningaloo Marine Park Monitoring Program* (NMPMP). The main aim of the NMPMP is to determine the health of the key benthic habitats of the Ningaloo Marine Park and the proposed southern extension of the marine park. The locality and boundaries of Ningaloo Marine Park and surrounds are shown in Figure 1. The first survey was conducted in May 1998 and involved the establishment of 21 long-term monitoring sites in coral communities. Areas identified as having a high level of human usage and being biologically unique were also visited to assist in selecting permanent monitoring sites for the next survey.

The field survey was coordinated by CALM in collaboration with the Australian Institute of Marine Science (AIMS). The Marine Conservation Branch (MCB) of CALM co-ordinated the program (Principle contact: Dr. Chris Simpson) which was conducted in collaboration with the Pilbara Regional Office (Contact: Fran Stanley) and the Exmouth District Office (Contact: Doug Myers).

Jennie Cary of the Marine Conservation Branch was the Field Team Leader and coordinated all activities in the field.

Other CALM field staff included Tim Daly, Mike Lapwood, Ian Gales, Jeff Myers, Tim Grubba and Justin Parker from the MCB; Tim Hamester from Exmouth District Office; and Peter Moore and Alan Shields from the Pilbara Regional Office. AIMS field staff include Andrew Heyward and Stuart Fields with Kim Brooks as a CALM/AIMS volunteer.

### 1.2 Background

The successful management of the marine environment is contingent upon comprehensive long-term monitoring programs that provide information on natural variability and long-term trends in key biological communities. Also to determine the status of important natural attributes at regular intervals and identify undesirable trends resulting from human activities in time for remedial management action to be implemented effectively. Monitoring programs generally comprise one or more of the following complementary objectives: (i) local scale impact and/or *compliance monitoring* that examines the effects of human activities in a localised area(s); (ii) temporally-constrained, broadscale *surveillance monitoring* to assess the impact of episodic regional physical and biological processes (eg the effect of cyclones and predators) and (iii) spatially-constrained, long-term monitoring of key biological parameters to determine the extent and cause of *natural variation* (eg seasonal and inter-annual variability) of key ecosystem attributes.

This report describes the first of a number of field surveys which will be conducted as part of the NMPMP. The spatial and temporal scale of on-going monitoring will determine the type of monitoring; i.e. surveillance, compliance or natural variability. As the coral communities are the most dominant benthic habitat, the major focus of the field program was to monitor the coral communities. As the majority of human activities in the marine park occur within the easily accessible lagoon and back-reef reef (on the sea-ward edge of lagoon) the majority of monitoring sites were established in these areas. In this survey long-term monitoring sites were established on back-reef coral communities. Quantitative biological information to assess the 'health' of the coral communities was obtained using video footage from re-locatable permanent transects. Long term monitoring sites were established to provide baseline ecological data from which the impacts from human activities can be monitored and managed to ensure that all activities are ecologically sustainable.

The NMPMP is linked to the recommendations of the *Ningaloo Marine Park Management Plan 1989-1999*;

- Monitoring of marine flora and fauna be carried out to gain an understanding of factors which influence the stability of marine communities in the Park.
- Monitoring and periodic surveys of recreational and commercial use in and adjacent to the park be carried out to determine the effect of human usage on marine communities in the Park.

### 1.3 Aims

The main aim of the NMPMP is to determine the 'health' of the major benthic habitats within the Ningaloo Marine Park and the southern extension. Primary objectives of the May 1998 field survey include:

- The establishment of re-locatable long-term monitoring sites on back-reef coral communities that are *representative* of the Ningaloo Marine Park and the proposed southern extension.
- Familiarization of areas identified as having a *high human usage* (generally in the lagoon) to assist in site selection for the next field survey.
- Familiarization of areas identified as *biologically unique* to assist in site selection for the next survey.
- The opportunistic collection of still photographs and video footage of major habitat types and visually dominant flora and fauna.

## 2 SITE SELECTION

### 2.1 Representative sites (including control sites)

Sites were selected to represent the ecological attributes of *back-reef* coral communities along approximately 300km of coastline from Bundegi reef in the north (Exmouth Gulf) to Gnarraloo in the south. A total of 21 representative sites were selected approximately every 15-20 km of coastline. These sites can be used for *surveillance monitoring* and a sub-set to monitor *natural variability*.

Site selection was further influenced if historical information of the 'health' of the coral communities from previous surveys was available. Historical data will assist in determining temporal changes. Studies reviewed to assist in site selection included:

- Ayling AM and AL (1987). Ningaloo Marine Park: Preliminary fish density assessment and habitat survey; with information of coral damage due to *Drupella cornus* grazing. A report of CALM.
- Forde MJ (1994). Ecology of the Muricid gastropod *Drupella cornus* and its significance as a corallivore on Ningaloo Reef, Western Australia. Master of Science degree from University of Western Australia.
- Osborne S and Williams (in preparation). Status of *Drupella cornus* outbreak at Ningaloo Reef. CALM report.
- Simpson *et al* (1993). Destruction of corals and other reef animals by coral spawn slicks on Ningaloo Reef, Western Australia. *Coral Reefs* **12**:185-191.
- Australian Institute of Marine Science - studies undertaken in Coral Bay.

Representative sites were located in Sanctuary Zones where possible. In general, sites located in Sanctuary Zones will be used as control sites as no extractive activities are permitted in these zones. The results of long-term monitoring at sites subjected to recreational and/or commercial pressures will be assessed in the context of natural variation at the control sites. This is a fundamental requirement for effective management.

It was initially proposed that approximately 18 long-term monitoring sites representative of the backreef coral communities would be established during this survey, with the possibility of additional 7 sites. Due to adverse weather and sea conditions only 15 of the original 18 sites and 6 of the 7 additional sites were established. (Table 1; Figure 2). Historical site information and data from Osborne and Williams (in preparation) was helpful in site selection (Appendices 1 and 2). Appendix 1 summarises historical site information. Appendix 2 summarises historical data on percentage cover of live coral, substrate type and *Drupella* density.

## 3 METHODS

At each long-term monitoring site in this survey, the coral community was surveyed and three permanent 50 m transects were established to monitor spatial and temporal changes in benthic composition. The transects were set along the back reef at a depth contour of approximately 2m. The transects were set in a line along the depth contour one after the other, however transect start and end points were separated by a 10 m space. The distance between the start of the first transect and the end of the last transect was 50+10+50+10+50=170m. The transects were permanently set using star pickets at the start and end points, with a 50 m scaled (every 10cm) and weighted transect line following the contour of the seabed. The position of the start of each transect was recorded using differential GPS (datum WGS 84) which provides an accuracy of better than 3 metres. The sessile benthic composition along each transect was then recorded at a set height and speed, using a high quality video camera in an underwater housing, resulting in a strip

transect 50 m long and 1 m in width being sampled. Appendix 3 summarises the sampling methodology for the collection of benthic habitat video imagery.

The video sampling method was developed by the Australian Institute of Marine Science (AIMS) to monitor the status of coral dominated benthic communities by detecting and quantifying major spatial and temporal changes in the percentage cover of sessile benthos (Christie *et al.* 1996). This survey technique provides a permanent record of benthic habitats which can be later analysed in a variety of different ways. A visual record is a very compelling method for identifying change and for highlighting impacts that may result from recreational and commercial usage.

At all sites recordings of benthic composition using the video transect technique were complemented with general information on the major benthic community types (coral and seagrass meadows etc.). The visually dominant species and the nature and extent of impacts (if present) were recorded either by direct observation from the boat (i.e. by viewfinder), or by divers taking general video footage and still photographs.

All habitat data and related observations were recorded electronically onto standard data files which had been pre-formatted and stored on a laptop computer. Data sheets for written data recordings were also made available. All written data were transferred to the computer files during the field survey, on the day of collection. These data sheets included:

1. *Transect data sheet* - with differential GPS latitude and longitudes for each of the 3 transects at each site.
2. *Long-term monitoring site data sheet* - a site map which includes vessel location, transect locations and other features of interest.
3. *Habitat data sheet* - describes the habitat at the site including dominant species and notes any impact or activity at the site.
4. *Video data sheet* - gives the video time codes for each transect at each site.

### **3.1 Establishment of permanent transects**

Each site consists of three permanent 50 meter transect lines placed end to end in a straight line with a 10m space between ends. A star picket was driven into the substrate at the start and end points of each transect. These were marked by a weighted marker float to enable DGPS coordinates to be obtained from the surface. Previous field trips have proven that transect deployment can be best achieved by using either procedures 1 or 2 or a combination of both depending on conditions, available vessels and personnel (Appendix 4). Appendix 4 summarises the general procedures followed.

## **4 RESULTS**

Each 'transect' site has data recorded on four data sheets; the Transect data sheet, Long-term monitoring site data sheet, Habitat data sheet and Video data sheet. The sites appear in the order shown in Table 1.

The original Hi-8 video tapes, will be archived by CALM's Information Management Branch and the VHS duplicates with the permanent transect data are stored at the Marine Conservation Branch in Fremantle. The Australian Institute of Marine Science (AIMS) has copies of the video tapes used to carry out analysis using AIMS Video Transect Analysis System (AVTAS).

### Habitat Description

Limestone pavement. High energy area (swell). Flat bottom, some depressions and ridges. Live coral: 2% (mean) Dead coral: 0% (mean) Algae: 35% (mean) Abiotic: 60% (mean)
---

### Dominant Species

<b>Seagrass</b>	Halophila ovalis
<b>Macro-algae</b>	Filamentous blue/green, Dictyota sp., Amphiroa foliacea
<b>Coral</b>	Acropora sp.—very small colonies; Pocillopora sp (2); Soft coral—Sarcophyton & Sinularia sps.; some Platygyra & Gonipora sps.
<b>Fish</b>	Dominant—Pomacentridae, Pomacanthidae, Labridae (juveniles); Scaridae (juveniles), Acanthridae, Balistidae, Rhinecanthus verrucosus
<b>Invertebrates</b>	Dominant—spirastrella vagabunda (sponge), Echinometra sp., Octopus cyanea; some Tripneustes gratilla, Linckia laevigata, Actinopga mauritiana, Echinometridae aciculatus, Oxycomanthus bennetti

### Other Features

Cowries: Cypraea tigris, Lambia chiragra (spider conch)
---

### Impact or Activity

High energy site.

<b>Site location</b>	NW of Neds Camp, W of Mangrove sanctuary						

### Habitat Description

Back reef - possibly exposed during low tide. Sparsely scattered live Acropora plate. Branching forms more abundant. Substrate dominated by dead (whole / broken up) Acropora plates all detached, overturned and Acropora corynbose species.  
 Live coral: 5% (mean)  
 Dead coral: 32% (mean)  
 Algae: 8% (mean)  
 Abiotic: 53% (mean)

### Dominant Species

<b>Seagrass</b>	Halophila ovalis
<b>Macro-algae</b>	Galaxaura sp? Rhodymenia sp growing over dead corals.
<b>Coral</b>	Echinopora sp., Acropora sp., Astrepora sp., Favites sp., Favia sp., Seriatopora caliendrum, Hyd ?
<b>Fish</b>	Dominant - Pomacanthidae & Acanthuridae. Others - Chaetodontidae & Scaridae
<b>Invertebrates</b>	Panulirus versicolor, Tridacne sp (40 cm)

### Other Features

Reef white tip shark - Triaenodon obesus

### Impact or Activity

Majority of reef 'old' dead coral, of Acropora species (plates & corynbose). New coral growth on old.

<b>Site location</b>	Backreef slightly south of launch site						

### Habitat Description

Back reef broken by distinct wash zones. Dominated by Acropora sp. Plate & corynbose. Large colonies of Sinularia sp. Drupella common feeding scars abundant on colonies.  
 Live coral: 16% (mean)  
 Dead coral: 60% (mean)  
 Algae: 2% (mean)  
 Abiotic: 22% (mean)

### Dominant Species

<b>Seagrass</b>	
<b>Macro-algae</b>	Dictyota sp. Turbinaria sp. Titanophora weberae ?
<b>Coral</b>	Sarrophyton sp. Acropora (plates & corynbose) Porities sp. Faviidae, Sinularia sp. Fungiidae, Montipora sp.
<b>Fish</b>	Acanthuridae & Scaridae dominant Lutjanidae Pomacentridae Labridae Chaetodontidae Pomacanthidae
<b>Invertebrates</b>	Drupella abundant. Holothuria sp. Diadema

### Other Features

Reef White Tip Shark - Triaenodon obesus Blue-spotted ray - Taeniura lymma

### Impact or Activity

Drupella and feed scars abundant (recent & old)

22° 14.708' S		113° 49.744' E			Yes	<input checked="" type="checkbox"/>	No <input type="checkbox"/>
<b>Site location</b>	Backreef coral community						

### Habitat Description

<p>Backreef - high mortality of plate corals (<i>A. hyacinthus</i>) resulting from <i>Drupella cornis</i> infestation. ~ 30% cover. <i>Drupella</i> aggregated under numerous coral colonies which showed obvious feeding scars. Also present were <i>Favites</i>; <i>Favia</i>; <i>Sinularia</i>; <i>Sarcophyton</i>; (30cm) <i>Pocillopora</i>; <i>Porites</i> ~ 5%</p> <p>Live coral: 2% (mean)          Dead coral: 69% (mean)          Algae: 1% (mean)          Abiotic: 25% (mean)</p>
---

### Dominant Species

<b>Seagrass</b>	
<b>Macro-algae</b>	<i>Titanophora weberae</i> , <i>Dictyota</i> sp, <i>Galaxaura marginata</i> , <i>Turbinaria</i> sp
<b>Coral</b>	<i>Acropora hyacinthus</i> (90% dead); <i>Drupella cornis</i> aggregations on remaining live cover; occasional massives( <i>Favites</i> , <i>Favia</i> , <i>Porites</i> )
<b>Fish</b>	<i>Acanthuridae</i> , <i>Chaetodontida</i> , <i>Pomacanthidae</i> , <i>Labridae</i> , <i>Scaridae</i> , <i>Lutjanidae</i> - abundant, <i>Pomacentridae</i> - abundant.
<b>Invertebrates</b>	<i>Drupella cornis</i> very abundant in aggregations on living corals

### Other Features

<p><i>Pocillopora</i>, soft corals (<i>Sinularia</i> and <i>Sarcophyton</i>)</p>
--

### Impact or Activity

<p>Significant impact from <i>Drupella cornis</i> visible on the <i>A. hyacinthus</i> plates.</p>

<b>Site location</b>	Boat Launched approximately 10.4 km south of Yardie Creek						

### Habitat Description

Backreef habitat. Sandy rubble substrate with high coral diversity of plate corymbose and arborescent *Acropora* sp. Many species of massives; though few fish.  
 Live coral: 22% (mean)  
 Dead coral: 48% (mean)  
 Algae: 3% (mean)  
 Abiotic: 27% (mean)

### Dominant Species

<b>Seagrass</b>	
<b>Macro-algae</b>	<i>Galaxaura marginata</i> , <i>Turbinaria</i> sp., Filamentous blue-green algae, <i>Dictyota</i> sp.
<b>Coral</b>	Dominant— <i>Acropora</i> sp. ( <i>digitifera</i> , <i>floridae</i> ); few <i>Montipora</i> sp., <i>Fungidae</i> sp., <i>Favites</i> sp.; Soft corals— <i>Sinularia</i> sp., and other sps.
<b>Fish</b>	Pomacentrids and Pomacanthids
<b>Invertebrates</b>	Holothurians

### Other Features

Few large mobile fish. The site was interspersed with large sandy patches; one patch of soft coral dominated approx 3.0m of substrate on the transect

### Impact or Activity

Some *Drupella*

## HABITAT DATA SHEET

<b>Project</b>	NINGALOO MARINE PARK MONITORING PROGRAM				<b>Field Survey</b>		MAY 1998
<b>Site No.</b>	N10	<b>Site Name</b>	Lefroy Bay	<b>Date</b>	14/5/98	<b>Recorder</b>	Grubba
<b>Vessel</b>	CALM Zodiac	<b>Time</b>	10.05	<b>Weather</b>			
<b>Sea</b>			<b>Water depth (m)</b>	1.0-2.0	<b>Water visibility (m)</b>		8.0-10.0
<b>GPS Latitude</b>		<b>GPS Longitude</b>			<b>Differential</b>		
22° 30.290' S		113° 41.913' E			Yes	<input checked="" type="checkbox"/>	No <input type="checkbox"/>
<b>Site location</b>	Lefroy Bay backreef—launch boat 24km south of yardie creek or 2 km south of main Winderabandi						

### Habitat Description

Shallow backreef habitat—sandy rubble substrate; relatively high diversity. Majority of colonies were young, except favids Live coral: 16% (mean) Dead coral: 64% (mean) Algae: 6% (mean) Abiotic: 22% (mean)
---

### Dominant Species

<b>Seagrass</b>	
<b>Macro-algae</b>	Galaxaura marginata, Dictyota sp., Filamentous blue-green algae
<b>Coral</b>	Dominant—Acropora sp. (mainly corymbose and large massive corals, few plates); Favites sp., Astreopora: Soft
<b>Fish</b>	Pomacentridae, few juvenile Labridae
<b>Invertebrates</b>	Holothurians (several sp.), large Tridacna

### Other Features

27-30m of transect 1 is covered by Sinularia sp.
--

### Impact or Activity

High proportion of old dead Acropora plates; some Drupella in transect 2.

### Habitat Description

Backreef coral habitat—Dominated by Acropora plates. Some Drupella. Live coral: 19% (mean) Dead coral: 54% (mean) Algae: 5% (mean) Abiotic: 23% (mean)
--

### Dominant Species

<b>Seagrass</b>	
<b>Macro-algae</b>	Dictyota sp., Turbinaria sp., Filamentous blue-green algae
<b>Coral</b>	Dominant—Acropora sp. plates (hyacnthus, digitate corals), Some Pocillopora, Favites sp., Lobophyllia, Gonipora, Favia sp.; some branching Acropora, Platygyra
<b>Fish</b>	Pomacentride, Labridae, Scaridae, Acanthuridae
<b>Invertebrates</b>	Holothurians

### Other Features

Access to Osbourne's Drupella sites was not possible due to adverse sea conditions (swell). Site placed outside of sanctuary due to low abundance of coral within sanctuary. Backreef/lagoon was dominated by limestone pavement covered with macro algae (if not sand).
--

### Impact or Activity

T1—Some Drupella—1.5 m, 19.0m, 36.0 m T3—Some Drupella—26.0m

## LONG-TERM MONITORING SITE DATA SHEET

## HABITAT DATA SHEET

<b>Project</b>	NINGALOO MARINE PARK MONITORING PROGRAM				<b>Field Survey</b>		MAY 1998
<b>Site No.</b>	N12	<b>Site Name</b>	Dugong Sanctuary	<b>Date</b>	17/5/98	<b>Recorder</b>	Cary
<b>Vessel</b>	CALM Zodiac	<b>Time</b>	12.00	<b>Weather</b>	5 Knots		
<b>Sea</b>			<b>Water depth (m)</b>	2.5	<b>Water visibility (m)</b>	15.0	
<b>GPS Latitude</b>		<b>GPS Longitude</b>			<b>Differential</b>		
22° 51.839 ' S		113 ° 45.521 ' E			Yes	<input type="checkbox"/>	No <input type="checkbox"/>
<b>Site location</b>	12Km north of Dugong Sanctuary southern boundary.						

### Habitat Description

Backreef—coral. NOT TYPICAL. More gaps in backreef than normal. Acropora plates and digitate forms dominated, but also many massives. Backreef 5km from shoreline.  
 Live coral: 24% (mean)  
 Dead coral: 67% (mean)  
 Algae: 1% (mean)  
 Abiotic: 8% (mean)

### Dominant Species

<b>Seagrass</b>	
<b>Macro-algae</b>	
<b>Coral</b>	Dominant—Acropora sp. Plates ( <i>A. hyacinthus</i> & digitate); some <i>Favites</i> sp., <i>Lobophyllia</i> , <i>Astreopora</i> , <i>Platygyra</i> , <i>Goniastrea</i> , <i>Leptora</i> , <i>Seriatopora</i>
<b>Fish</b>	Chaetodontidae, Pomacanthidae; few large fish sp.
<b>Invertebrates</b>	Holothurians, clams; few nudibranchs and sea stars ( <i>Linckia laevigata</i> , <i>Formia indica</i> ), urchins, <i>Drupella</i>

### Other Features

Coral reef occurs up to 800m east of reef crest. Limestone pavement covered in macro algae (mainly sargassum) occurs from shoreline to 4km offshore.

### Impact or Activity

*Drupella* relatively common on *Acropora*—more than other backreefs south of Yardie (up to this point in survey); but, not as much as north of Yardie Creek.

<b>Site location</b>	North of Bruboodijoo Pt; 9 mile camp launching site (9miles north of Coral Bay)						

### Habitat Description

Backreef dominated by Acropora sp. Plates. Over 90% of plates are dead, of these few are detached. Patches in between plates are sand /rubble and branching Acropora sp. Area subject to strong water movement from reef crest. Acropora mortality is probably due to high densities of Drupella (past and Present)

Live coral: 11% (mean)  
 Dead coral: 75% (mean)  
 Algae: 7% (mean)  
 Abiotic: 4% (mean)

### Dominant Species

<b>Seagrass</b>	
<b>Macro-algae</b>	Filamentous blue-green, Dctyota sp., Turbinaria sp., Zellura tawallina
<b>Coral</b>	Dominant: Acropora sp. Plates; few branching & digitate Acropora, Monitpora sp., Fungia, Favids, Hydnohpora and Sinularia sp., Lobophyllia
<b>Fish</b>	juvenile Labridae; Pomacentridae; some Pomacanthidae and Chaetodontidae; large schools of Acanthurids, med sized Scarids
<b>Invertebrates</b>	Giant clams, Very high abundance of Drupella, hermit crabs using Drupella shells

### Other Features

Site similar to Yardie Creek (N21) except Acropora plates (dead) more extensive

### Impact or Activity

Impact due to Drupella severe (worst since N1-N14). 90% of Acropora plates dead (past) (some 1.5m diameter). 10% of Live Acropora showing feeding scars. Drupella also feeding on branching Acropora.

<b>Project</b>	NINGALOO MARINE PARK MONITORING PROGRAM				<b>Field Survey</b>		MAY 1998
<b>Site No.</b>	N14	<b>Site Name</b>	Coral bay/Bill's Bay	<b>Date</b>	19/5/98	<b>Recorder</b>	Grubba
<b>Vessel</b>	CALM Zodiac	<b>Time</b>	10.30	<b>Weather</b>	5 knots SE		
<b>Sea</b>	Calm	<b>Water depth (m)</b>	2.0	<b>Water visibility (m)</b>	18.0		
<b>GPS Latitude</b>		<b>GPS Longitude</b>		<b>Differential</b>			
23° 08.881' S		113° 44.965' E		Yes	<input checked="" type="checkbox"/>	No	<input type="checkbox"/>
<b>Site location</b>	Directly out from Coral Bay township. 150m south of glass bottom boat mooring.						

### Habitat Description

<p>Backreef—dominated by massives/submassives/digitate <i>Acropora</i> sp. Dead <i>Acropora</i> plates, digitate and dead Branching <i>Acropora</i>. Transect passes through some sandy patches. Some large colonies of massive corals. T2 passed through a rubble zone.</p> <p>Live coral: 13% (mean)          Dead coral: 42% (mean)          Algae: 1%          Abiotic: 26% (mean)</p>
--

### Dominant Species

<b>Seagrass</b>	
<b>Macro-algae</b>	<i>Dictyota</i> sp., <i>Galazaura marginata</i> , Filamentous blue-green algae
<b>Coral</b>	<i>Acropora</i> sp. (digitate, <i>grandis</i> ), <i>Montipora</i> sp., <i>Favites</i> , <i>Platygyra</i> , Echinopora few fungia, <i>Merulina</i> sp.; Soft coral— <i>Sinularia</i> sp.
<b>Fish</b>	Pomacentridae, med sized Scaridae, Acanthuridae
<b>Invertebrates</b>	Several clams; few sea stars & Holothurians

### Other Features

<p>No visible <i>Drupella</i> scars or animals. <i>Acropora</i> has not and has not been a dominant coral in this area.</p>
---

### Impact or Activity

<p>Med to high energy site—seems to be some sand scouring (beginning T1). Some storm damage. Glass bottom boat/snorkelling/boat mooring 150m to the north. No <i>Drupella</i> observed.</p>

### Habitat Description

<p>Backreef/ partial lagoonal type coral. Dominated by Acropora sp. –both plate (1m diam.) and branching corals. Very diverse site with several species of Acropora, Favites, Fungi, Montipora and soft corals. 40-50% live coral with some sandy patches. No Drupella seen, nor any feeding scars evident.</p> <p>Live coral: 66% (mean)          Dead coral: 27% (mean)          Algae: 0% (mean)          Abiotic: 6% (mean)</p>
---

### Dominant Species

<b>Seagrass</b>	
<b>Macro-algae</b>	Dictyota sp., Filamentous blue-green algae, Coralline algae, Turbinaria sp.
<b>Coral</b>	Dominant—Acropora sp. (digitate plates and branching); Favites sp., Playgyra sp., encrusting Montipora sp.; soft
<b>Fish</b>	Pomacanthidae, Pomacentridae, Chaetodontidae
<b>Invertebrates</b>	Sea stars (Formia indica, Linckia laevigata), Holothurians, Echinometra sp., few clams

### Other Features

--	--

### Impact or Activity

<p>Low impact site due to sites isolation. Moderate energy site. Majority of dead coral is old but attached.</p>
--

### Habitat Description

<p>Backreef dominated by high diversity of <i>Acropora</i> sp. and growth forms. Very narrow backreef and reef. High diversity of Pomacentridae and medium sized Scarids. Bottom is coral rubble with approximately 30% live coral cover.</p> <p>Live coral: 22% (mean)          Dead coral: 39% (mean)          Algae: 0% (mean)          Abiotic: 41%</p>
---

### Dominant Species

<b>Seagrass</b>	
<b>Macro-algae</b>	
<b>Coral</b>	<i>Acropora</i> sp. (high diversity—plate and branching), 1 <i>Porites</i>
<b>Fish</b>	Pomacentridae, Scaridae, Lutjanidae, Chaetodontidae
<b>Invertebrates</b>	1 <i>Panulirus versicolor</i>

### Other Features

1 Potato grouper ( <i>epinephelus tukula</i> ); 1 Reef Whitetip shark ( <i>Triaenodon obesus</i> ), uniquely shaped <i>Acropora</i> sp.
---

### Impact or Activity

No visual human impacts; Previous cyclone damage

## LONG-TERM MONITORING SITE DATA SHEET

<b>Project</b>	NINGALOO MARINE PARK MONITORING PROGRAM				<b>Field Survey</b>		MAY 1998
<b>Site No.</b>	N20	<b>Site Name</b>	Jurabi Pt.	<b>Date</b>	12/598	<b>Recorder</b>	Myers
<b>Vessel</b>	CALM Zodiac		<b>Time</b>	10.15	<b>Weather</b>	S/SE 20 knots	
<b>Sea</b>	Swell 1.0m		<b>Water depth (m)</b>	4.0	<b>Water visibility (m)</b>	15.0-20.0	
<b>GPS Latitude</b>		<b>GPS Longitude</b>			<b>Differential</b>		
21° 51.412' S		113° 59.951' E			<b>Yes</b>	<input checked="" type="checkbox"/>	<b>No</b> <input type="checkbox"/>
<b>Site location</b>	northern edge of the barrier reef out from Jurabi Pt.						

### Habitat Description

More lagoonal than backreef site. High energy site with swell and surge. Limestone pavement with many depressions, ridges and overhangs. Dominated by soft coral. Good fish life. Acropora and Pocillopora recruitment.

Live coral: 15% (mean)

Dead coral: 74% (mean)

Algae: 0% (mean)

Abiotic: 12% (mean)

### Dominant Species

<b>Seagrass</b>	
<b>Macro-algae</b>	Dictyota sp., Galaxaura marginata
<b>Coral</b>	Dominant—soft corals—Sinularia sp, Lobophyton sp., Sarcophyton sp.; Heliopora coerulea, Millepora sp., Acropora sp. (digitate), Favites sp.; few Montipora, Porites, Pocillopora—many recruits
<b>Fish</b>	Many Chaetodontidae, Pomacanthidae & Labridae sps.; few Scaridae
<b>Invertebrates</b>	Many sponges (spirastrella vagabunda), feather stars (few); many Holothurians, urchins, sea stars (Formia indica), few clams

### Other Features

1 Cypraea tigris  
1 Cypraea teres

### Impact or Activity

Evidence of some bleaching on some Acropora & Favites sp.—some recently dead coral, but no Drupella found.

22° 18.909' S		113° 47.783' E			Yes	<input checked="" type="checkbox"/>	No <input type="checkbox"/>
<b>Site location</b>	Backreef location slightly north of the boatramp						

### Habitat Description

<p>backreef habitat - extensive dead coral remains of <i>Acropora hyacinthus</i> plate habitat. High level of recruit of <i>Acropora</i> spp 3 - 30cm colonies. Death original plates may be very historic (10 years plus).          Live and dead <i>Drupella</i> present, recent feeding scars less evident. Massives and encrusting also recruiting.          Live coral: 4% (mean)          Dead coral: 85% (mean)          Algae: 0% (mean)          Abiotic: 11% (mean)</p>
---

### Dominant Species

<b>Seagrass</b>	
<b>Macro-algae</b>	<i>Dictyota</i> , <i>galaxaura marinata</i> , <i>Titanophora weberae</i>
<b>Coral</b>	dominant <i>Acropora</i> recruits 3-30cm, some <i>merulina</i> , <i>favites</i> sp, <i>favia</i> sp, <i>lobophyllia</i> , <i>montipora</i> , <i>platygyra</i> , <i>sinularia</i> sp, <i>galaxea</i> , <i>fungia</i> , <i>sarcophyton</i> , <i>millipora</i> , <i>fungia</i> .
<b>Fish</b>	<i>chaetodontidae</i> , <i>Pomacanthidae</i> , <i>Pomacentridae</i> , <i>scaridae</i>
<b>Invertebrates</b>	<i>linkia</i> (starfish), <i>Fromia</i> sp (starfish), <i>echinometra</i> sp, <i>holothuria</i> sp, <i>Drupella cornis</i>

### Other Features

--

### Impact or Activity

<p>Extensive death of plate corals may be the result of some natural extreme conditions, extreme low tide (pers comm, Luke Smith and Exmouth locals), <i>Drupella cornis</i> infestation.</p>

### Habitat Description

Backreef dominated by old (dead) *Acropora* plates (1.0m diam.) with about 5 % live coral cover. Many juvenile recruits seen of *Acropora* and a few *Favites* sp. Areas of sand and rubble seen—storm damage present. Few *Drupella* found and few scars seen. Diverse fish life. Some seagrass (*Halophila*) present.  
 Live coral: 9% (mean)  
 Dead coral: 80% (mean)  
 Algae: 3% (mean)  
 Abiotic: 8% (mean)

### Dominant Species

<b>Seagrass</b>	<i>Halophila ovalis</i> (sparse)
<b>Macro-algae</b>	<i>Turbinaria</i> sp, <i>Dictyota</i> sp., Filamentous blue-green algae, <i>Valonia ventricosa</i>
<b>Coral</b>	Dominant— <i>Acropora</i> sp. (plates & <i>digitifera</i> ); few <i>Platygyra</i> sp. & <i>Favites</i> sp.; few <i>Montipora</i> sp.; few soft
<b>Fish</b>	Dominated by <i>Labridae</i> , <i>Pomacentridae</i> , <i>Pomacanthidae</i> and some schools of <i>Chaetodontide</i> ; some <i>Monacanthidae</i> , <i>Amphiprion</i> sp. ( <i>Anemonefish</i> ); few <i>Scarids</i>
<b>Invertebrates</b>	Few <i>Holothurians</i> , <i>Echinometra</i> sp.; seastars ( <i>Linckia</i> sp., <i>Formia indica</i> ); few <i>Anemone</i> within rubble; giant clams

### Other Features

--

### Impact or Activity

High energy site; evidence of storm damage, minimal <i>Drupella</i> impact seen

<b>Site location</b>							

### Habitat Description

<p>Backreef dominated by Acropora plates; plate sizes 0.5m-2.0+m in diameter. 60-70% live Acropora sp. Some areas of sand and some damaged/overturnd plates. Evidence of recruitment. Drupella found easily, but there was minimal scarring seen.</p> <p>Live coral: 53% (mean)          Dead coral: 41% (mean)          Algae: 1% (mean)          Abiotic: 5% (mean)</p>
---

### Dominant Species

<b>Seagrass</b>	
<b>Macro-algae</b>	Dictyota sp., Turbinaria sp., Filamentous blue-green algae, Coralline red algae
<b>Coral</b>	Acropora sp. (plates) (digitifera and others); some branching Acropora sp.; few Fungidae, few soft coral—Sinularia sp.; some encrusting Monitpora sp.
<b>Fish</b>	Dominant—Pomacentridae, Pomacanthidae; schools of Labridae and med-sized Scarids; few Monacanthidae and flutemouth fish
<b>Invertebrates</b>	Sea stars (Formia indica); few Holothurians, urchins, clams

### Other Features

--	--

### Impact or Activity

<p>Some (but little) storm damage seen. Drupella was abundant, but scarring was relatively minimal</p>

### Habitat Description

Three different habitat types through transects 1, 2, and 3  
T1, Channel - large bommies  
T2 Backreef dominated by Acropora plate  
T3 Wash zone - coral rubble and Acropora  
Live coral: 11% (mean)  
Dead coral: 74% (mean)  
Algae: 0% (mean)  
Abiotic: 14% (mean)

### Dominant Species

<b>Seagrass</b>	
<b>Macro-algae</b>	Filamentous Blue-green algae, Dictyota sp., Turbinaria sp.
<b>Coral</b>	Acropora plate & massives dominated at T1; some Millepora, Lobophyllia, Favids, Favites, Galaxea
<b>Fish</b>	Acanthuridae, Pomacentridae, Labridae
<b>Invertebrates</b>	

### Other Features

--

### Impact or Activity

Some Drupella in T3

	<i>Drupella</i> (dead)	0.36	0.33

Note: Live Hard Coral, Soft Substrate and Hard Substrate data is mean % cover  
*Drupella* data is mean estimated density (snails/m<sup>2</sup>)

## Appendix 3

### Sampling methodology for the collection of benthic habitat video imagery

This sampling technique is adapted from the AIMS Standard Operating Procedure No. 2 (Christie *et al.*, 1996). The steps required for preparation of the underwater housing and video camcorder are included in Appendix III. The recording of data for each transect should be carried out according to the following steps:

- 1 Fill out the details on the in-water data sheet (located on the top of the housing) identifying the transect. Record the site number, date, transect number, and recorder's name.
- 2 Set the camcorder to **autofocus**, press REC and video a panoramic shot of the start of the transect. Start at the star picket, hold the camera in a horizontal position and turn slowly clockwise, videoing the immediate surroundings and ending at the initial view. Move in on the top of the star picket to record the site number and transect number written on the white plastic cap. Press STBY.
- 3 Record the start time code on the data sheet. Press REC and video the base of the star picket for a few seconds and then move along the tape or scaled rope, keeping it approximately 10 cm in from the right hand side of the field of view. Keep the housing lens parallel to the substrate at a distance of 30 cm.
- 4 Follow the transect line keeping the housing at the set height of 30 cm, ensuring that the screen image is in focus. Adjust your swimming speed so that it is constant and you cover approximately 10 m every minute, and not faster. This is important to ensure a high quality of image. The entire transect should take between 5 and 6 minutes in total. At the end of the transect video the base of the star picket for a few seconds and then press STBY.
- 5 Record the finish time code on the data sheet.
- 6 If video recording along a transect has to be aborted for any reason, or if there is considerable variation in the height or speed of the recorder, then the entire transect should be re-sampled, beginning again from the start point of the transect. It is important that the new start and finish time codes for any repeated transects are clearly recorded on the data sheets.
- 7 Proceed to the next transect. Once all three transects at a site have been completed and the tape has been viewed and checked back on the vessel, full details must be recorded on the main video transect data sheet (Appendix II). Any repeated or incomplete transects, or situations where transects were recorded out of order or with false starts should be noted on the data sheets.
- 8 A total of three sites should be recorded on each 90 min Hi8 tape. The tape and tape cover should be clearly labeled (using a permanent marker) with the designated tape number (Appendix III), the site number and date of recording. The red copy protect switch on the tape should be switched on to prevent accidental recording over any data, and the tapes should be stored in a waterproof case at all times.
- 9 At the end of the field trip and before data analysis the tapes must be duplicated, either in Hi8 or VHS format, and the originals archived and stored separately from the duplicates.

## Appendix 4

### Establishment of permanent ‘transect sites’

The following sequence describes the basic field procedure that was followed to establish three permanent transects at each site. The entire procedure took between 2 and 4 hours, depending on *in situ* conditions, enabling at least two sites to be visited a day.

### Daily procedure summary

1. Personnel and equipment leave main camp and move to ‘day camp’ (a point on the beach as close as possible to the site).
2. Boats are launched, gear made ready.
3. Boat 1 leaves the beach followed by boat 2 about 15 minutes later.
4. Transect lines are set, filmed and retrieved as described in the methods below.
5. Boats 1 and 2 takes divers back to ‘day camp’ to change air tanks, camera batteries etc. and check video footage. Boat 2 also brings back site data (start and end point coordinates, transect layout sketch, dive times, video times etc.) for shore person to enter onto data sheets.
6. Boats are retrieved and gear stored.
7. Personnel and equipment leave day base to either return to base camp or move directly to second site (if applicable) and setup second ‘day camp’.
8. Steps 2 through 7 are then repeated.

### Establishment of transect using boat.

To be used in calm conditions with low current and relatively flat bathymetry. The transect lines will be laid out and retrieved by boat rather than by divers.

#### Boat 1 (2 persons: 1 boat operator, 1 field crew)

1. Boat 1 will reconnoiter general area using pre-marked aerial photographs and GPS readings as guidance.
2. The site is viewed using a viewfinder or a snorkel diver to confirm suitability of the site.
3. The end of the transect line is clipped to the weight of the start point marker buoy as it is deployed.
4. The transect lines are run out by driving the boat in a straight line on a predetermined compass bearing.
5. When the end of each transect line is reached it is clipped to the weight of the end point marker buoy as it is deployed.
6. This process is repeated for the last two transects.
7. Boat 1 deploys a snorkeler to check that the transect line was laid straight. If possible the snorkeler straightens the transect line where necessary. If the snorkeler is unable to correct the transect line, that person informs one of the SCUBA equipped divers whom will make the necessary adjustments.
8. Boat 1 stands by as it waits for boat 2 divers to install star pickets and video the transects. Boat 1 then retrieves it’s divers.
9. Boat 1 then takes DGPS readings at the marker buoys to determine the positions of the beginning of each transects and the end of transect 3.

10. Boat 1 then retrieves the transect lines, and in the event of the line becoming snagged a diver from boat 2 (or a snorkeller from boat 1) enters the water to un snag the line.

Boat 2 (4 persons: 1 boat operator, 3 divers)

1. As soon as the first transect is set, boat 2 with three divers moves into position over the beginning of transect 1. The three divers are deployed. One diver has the role of video camera operator, the second divers is a data recorder, and the third diver installs the star pickets.
2. The three divers descend to the beginning of the first transect designated by the weight of the marker buoy.
3. The installation diver then hammers a star picket into the substrate at the beginning of the transect, attaches the polypipe extension and positions the weight adjacent to the picket.
4. The camera operator films the surrounding reef. Anything that is of significance is also taped. The site and transect details inscribed on the first picket are taped. Then the diver proceeds video taping along the transect line (Section 2.2.2).
5. The data recorder diver follows the diver video taping the transect. This diver is making general observations about the reef, any visual impacts etc. This diver can also draw mud-maps of the location of the star picket in relation to coral/sand landmarks.
6. The diver installing the pickets, after securing the first picket swims to the end of the first transect plus the 10m extension and hammers another picket into the substrate to define the start point of the second transect. This process is continued for the third transect and a final picket is driven in at the end of the third transect.
7. The other two divers collecting data repeat steps 4 through 5 for the remaining transects.
8. The divers then return to the boat 2 which will be waiting at the end of transect 3. Boat 2 stands by as boat 1 takes a DGPS fix and completes the retrieval of the transect lines. Boat 2 deploys a diver if the transect line becomes snagged during retrieval. Both boats then return to the launch site.

**Establishment of transect by divers.**

To be used when adverse wind, current or irregular bathymetry make the previous procedure impractical.

Boat 1 (3 persons, boat person and 2 divers)

1. Boat 1 will reconnoiter general area using pre-marked aerial photographs and GPS readings as guidance.
2. The site is viewed using a viewfinder or a snorkel diver to confirm suitability of the site.
3. A weight and float will be deployed at the start point of the first transect.
4. Boat 1 deploys divers with pickets, hammer and transect line (still on reel) at transect 1 start point.
5. Divers hammer star picket in substrate, attach the polypipe extension and position weighted marker float adjacent to picket.
6. Divers clip the transect line to the marker weight and run it out on a predetermined compass bearing.
7. At the end of the transect the divers hammer a star picket into the substrate, and attach the polypipe extension.
8. Divers continue to run transect line out for 10m (unmarked colored line). At the end of 10m the star picket marking the start of transect 2 is driven into the substrate and polypipe extension attached. Another marker buoy attached to a weight is positioned adjacent to the star picket.
9. The divers then repeat steps 5 through 8 for the last two transects and place a marker buoy at the end of transect 3

10. Divers then surface and are retrieved by boat 1. Boat 1 will standby until boat 2 has retrieved it's divers.
11. Boat 1 then takes DGPS coordinates of the transect start points. Boat 1 then retrieves the transects lines. In the event of the transect line becoming snagged a snorkeller from boat 1 re-enters the water to un-snag the line.

Boat 2 (3 persons: 1 boat operator, 2 divers)

1. As soon as boat 1 has completed the laying of transect 1, the two video divers are deployed. One diver has the role of video camera operator, and the second is data recorder. Diver 1 descends with the video camera, diver 2 with underwater slates.
2. The divers descend to the beginning of transect 1. The camera operator films the surrounding reef. Anything that is of significance is also taped. The site and transect details inscribed on the first picket are taped. Then the diver proceeds video taping along the transect line (Section 2.2.2).
3. Diver 2 removes the end of the transect line from the star picket and then follows diver 1 who is video taping the transect. Diver 2 also records general observations about the reef, any visual impacts etc. Diver 2 will also draw mud-maps of the location of the star picket in relation to coral/sand landmarks.
4. Steps 2 through 3 are repeated for transects 2 and 3 .
5. The divers then return to boat 2 and standby as boat 1 completes the retrieval of the transect lines. Then both boats return to the launch site.
