Acknowledgments

We would like to thank Jim Lane who oversaw the administration of the project and for access to his 1980 photography; Mike Lyons, Grant Pearson, Bronwen Keighery and Andrew Webb for assistance with the fieldwork; and Ian Wilson, Roger Hearn and Dave Gardiner for local liaison and support. Andrew Storey provided the location map, Holly Smith drafted the vegetation maps.

Disclaimer

This project was funded under the National Wetlands Program of Environment Australia's Biodiversity Group (formerly the Australian Nature Conservation Agency). The views and opinions expressed in this report are those of the authors and do not necessarily reflect those of the Head of the Biodiversity Group of Environment Australia or the Executive Director of the Western Australian Department of Conservation and Land Management (CALM).

Recommendations

- 1) Detailed biological assessments be made in the appropriate season before consideration is given to granting any approval to establish drains into the conservation reserves of the Byenup - Muir system.
- 2) Detailed *Phytophthora* dieback assessments be mandatory before any drain system is established in the conservation reserves of the Byenup - Muir system.
- 3) Immediate action be taken to close any illegal drainage into the Byenup - Muir Nature Reserves.
- 4) The zoning of dieback hazard of the low lying areas of the reserves be changed to moderate - high.
- 5) Further detailed studies be undertaken on Byenup Lagoon to determine if the apparent decline of the sedgeland in 1995 was a result of increased salinity levels.
- 6) Detailed time series analysis of available photography be undertaken to assess the impact of drainage in the north west corner of Kulunilup Nature Reserve.
- 7) Possible impacts of *Armillaria* infections in Lake Muir Nature Reserve be investigated.
- 8) At Bokarup Nature Reserve, the *Acacia dealbata* thicket and the *Watsonia* infestation on the dune between the wetlands be removed before they become a major weed problems.
- 9) At Galamup Nature Reserve, the *Acacia longifolia* subsp. *longifolia* infestation be removed before it becomes a major weed problem.
- 10) Nutrient outflow from dams on the boundaries of Cobertup and Galamup be ameliorated to stop habitat degradation and weed spread into the reserves.
- 11) *Tribonanthes* sp. Lake Muir (GJK & NG 2387), which appears to be endemic to the Byenup - Muir reserves, be listed on CALM's priority flora list as a Priority 4 taxon.

Abstract

The study confirmed the high conservation values of Byenup - Muir wetland reserves in terms of both flora and diversity of plant communities recorded. A total of 976 taxa were recorded in 13 reserves, this included 3 species of Declared Rare Flora and 33 taxa on CALM's priority flora list. Structural vegetation mapping carried out in 9 reserves showed a complex mosaic of more than 30 vegetation types.

Eryngium sp. Lake Muir (E Wittwer 2293) and *Tribonanthes* sp. Lake Muir (GJK & NG 2387) appear to be endemic taxa to the Byenup - Muir area. The Lake Muir Nature Reserve contains the only known populations of *Euphrasia scabra* and *Lilaeopsis polyantha* in WA. The Byenup - Muir wetland reserve system fulfils at least four criteria for listing as a wetland of international importance under the Ramsar Convention.

The major threats to conservation values of the reserve system identified were (a) increases in salinity resulting from drainage schemes and rising water table and (b) spread of dieback. Major changes in plant communities in many of the wetlands have occurred since 1980. These changes were not just confined to lake margins but also occurred in sumplands and damplands.

Introduction

The Byenup - Muir wetland complex covers a sequence of basin wetlands, swamps, seasonally wet flats and low sandy and occasionally lateritic rises in the south west of Western Australia. It is unusual in that this wetland complex is largely undisturbed and contains peat based wetlands which are very rare in Western Australia (ANCA 1996, CALM 1998). The wetland complex is reserved in 13 separate nature reserves (Bokarup, Cobertup, Coverup, Galamup, Kodjinup, Kulunilup, Lake Muir, Noobijup, Pindicup, Pinticup, Quindinup, Unicup and Yarnup).

The broad plain on which most of the wetlands occur has had a complex geological history. The area was subject to several marine incursions while most of the soils are of Tertiary and Quaternary age and represent infilling of blocked paleodrainge systems (Wilde & Warker 1984, Chakravartula & Street 1999). Churchwood *et al.* (1988) mapped landforms and soils south of Byenup Lagoon. The wetlands fell into their swampy terrain landform with Cambellup (plains with drainage floors, swamps and low rises) and Morande (lunettes, dunes, hummocks and intervening swamps) being the most common units. Chakravartula & Street (1999) have recently produced a more detailed soil interpretation from airborne radiometric data for the entire Muir and Unicup catchments.

Regional vegetation mapping at 1:250 000 scale was undertaken by Smith (1972) and at 1: 1 000 000 scale by Beard (1981). The reserves fall mainly into Beard's Kwornicup vegetation system with the upland areas around Unicup Nature Reserve in the Jingalup vegetation system. The Jingalup uplands have extensive areas of lateritic capping and deeply dissected watercourses. Most of this system is dominated by eucalypt woodland with the creek lines dominated by *Eucalyptus rufa*, *Melaleuca cuticularis* and *M. viminea*. The more extensive Kwornicup system is characterised by a poorly drained swampy plain between the headwaters of the Kent, Hay and Gordon Rivers. The vegetation is a mosaic of Jarrah - Marri forests, paperbark low forest and reed swamps, with *Eucalyptus decipiens* occurring on sandy swampy sites as the dominant or understorey species. Clay swamps usually contain stands of Yate with an understorey of *Melaleuca cuticularis* and *M. violacea* while sandy swamps may have dense stands of *Melaleuca cuticularis* grading into reed swamps (Beard 1981).

The broad scale vegetation mapping gives little indication of the degree of patterning or the array of plant communities found in the area. More detailed information is available for three of the nature reserves (Kulunilup, Unicup and Yarnup, Griffin 1984). In that report Griffin described 24 vegetation associations ranging from upland lateritic Jarrah communities to shrublands and sedgelands of the wet flats and commented on the gradational nature of the vegetation with the complex mosaic apparently related to soil type, moisture status and salinity.

The aim of the present work was to map the nine wetland reserves for which detailed vegetation information is lacking, to compile species lists for the reserves, and to establish monitoring sites across the wetland system to provide baseline data from which future change can be measured.

Methods

Vegetation and flora

Structural vegetation mapping was undertaken for Bokarup, Cobertup, Cowerup, Galamup, Kodjinup, Lake Muir, Noobijup, Pindicup, Pinticup Nature Reserves using 1:25 000 stereo colour airphotos (WA3619 - 23/10/95) (Figure 1). Structural units were mapped then field checked by traverses of external boundaries and internal tracks. The Lake Muir Reserve is over 11,000 ha and much is inaccessible by vehicle, mapping units in this reserve were checked by air. Vegetation units were found to occur in complex mosaics and broad units similar to those used by Griffin (1984) were adopted.

For each reserve detailed flora lists were compiled by major vegetation unit. The lists for Lake Muir and Cowerup Nature Reserves are considered preliminary because of the large size in the case of Lake Muir and lack of sampling of annuals in Cowerup. Species lists are considered more complete than lists by vegetation types. The mapping and flora survey was undertaken over five field trips during spring, summer and autumn from 1997 to 1999. Voucher collections were lodged in the Western Australian Herbarium. Nomenclature generally follows Green (1985) and current usage at the Western Australian Herbarium (ms indicates manuscript name).

Current vegetation patterns and aerial photographs were compared to oblique aerial photography taken by JAK Lane in 1980 of many of the reserves. This allowed a qualitative assessment of vegetation change within the reserves over the last 19 years. Historic and recent oblique photography is appended to the report on a cd-rom.

Wetland monitoring

For the wetland monitoring 47 quadrats were located over 27 wetlands (Figure 1). Each quadrat was 5m x 10m with corners marked by steel droppers or star bars. In basin wetlands plots were laid out with their long axis parallel to the lake shoreline. Between one and three plots were established at each wetland. Lists were complied of all vascular species encountered at each site. Percentage cover was estimated for each species (<2, 2-10, 10-30, 30-70, >70%), however only presence / absence data was used in the present analyses. All quadrats were scored on two occasions to ensure that comprehensive lists of the annual flora were achieved. The position of the quadrats was fixed with a GPS unit. The wetland was classified as either permanent or seasonal, into the Semeniuk & Semeniuk (1997) and Ramsar (ANCA 1996) wetland classification systems. Notes were also made on slope, aspect and soil type. Macroinvertebrates, fish and water quality sampling was also undertaken at these 27 wetlands and will be reported elsewhere (A. W. Storey, pers. comm.).

The 47 sites were classified using Bray Curtis dissimilarity measure and UPGMA fusion strategy for both the normal and inverse classifications. Singletons (taxa occurring at only one site) were included in the analysis.

Results and Discussion

Flora

Reserve summaries, new vegetation mapping and flora lists for the 13 reserves of the Byenup - Muir wetland system are given in Appendix 1. A total of 976 taxa were recorded from the 13 reserves (Appendix 2), of these 862 were native and 114 were introduced. The most species rich native families were the Orchidaceae (70 taxa), Cyperaceae (65 taxa), Myrtaceae (60 taxa), Proteaceae and Papilionaceae (52 taxa), Asteraceae (50 taxa) and Stylidiaceae (36 taxa). The families with the most introduced taxa were Poaceae (22 taxa), Asteraceae (18 taxa) and the Papilionaceae (12 taxa).

During the survey three taxa listed as Declared Rare Flora were recorded from the area, as were 33 taxa listed on CALM's priority flora list (Atkins 1998, Table 1). This is a considerable increase in the number of priority flora previously reported (3 DRF and 4 priority species - CALM 1998).

This is a rich flora for such a small area being more than 10% of that recorded for the south west, about half that recorded for Fitzgerald River National Park (Newbey & McQuoid 1997) and more than that known for Lesueur National Park (Griffin *et al.* 1990), both these latter areas are major centres of biodiversity in south west Western Australia (Table 2). The reasons for such diversity in the Byenup - Muir area probably relate to complexes of soil types and hydrological patterns (both local and regional)

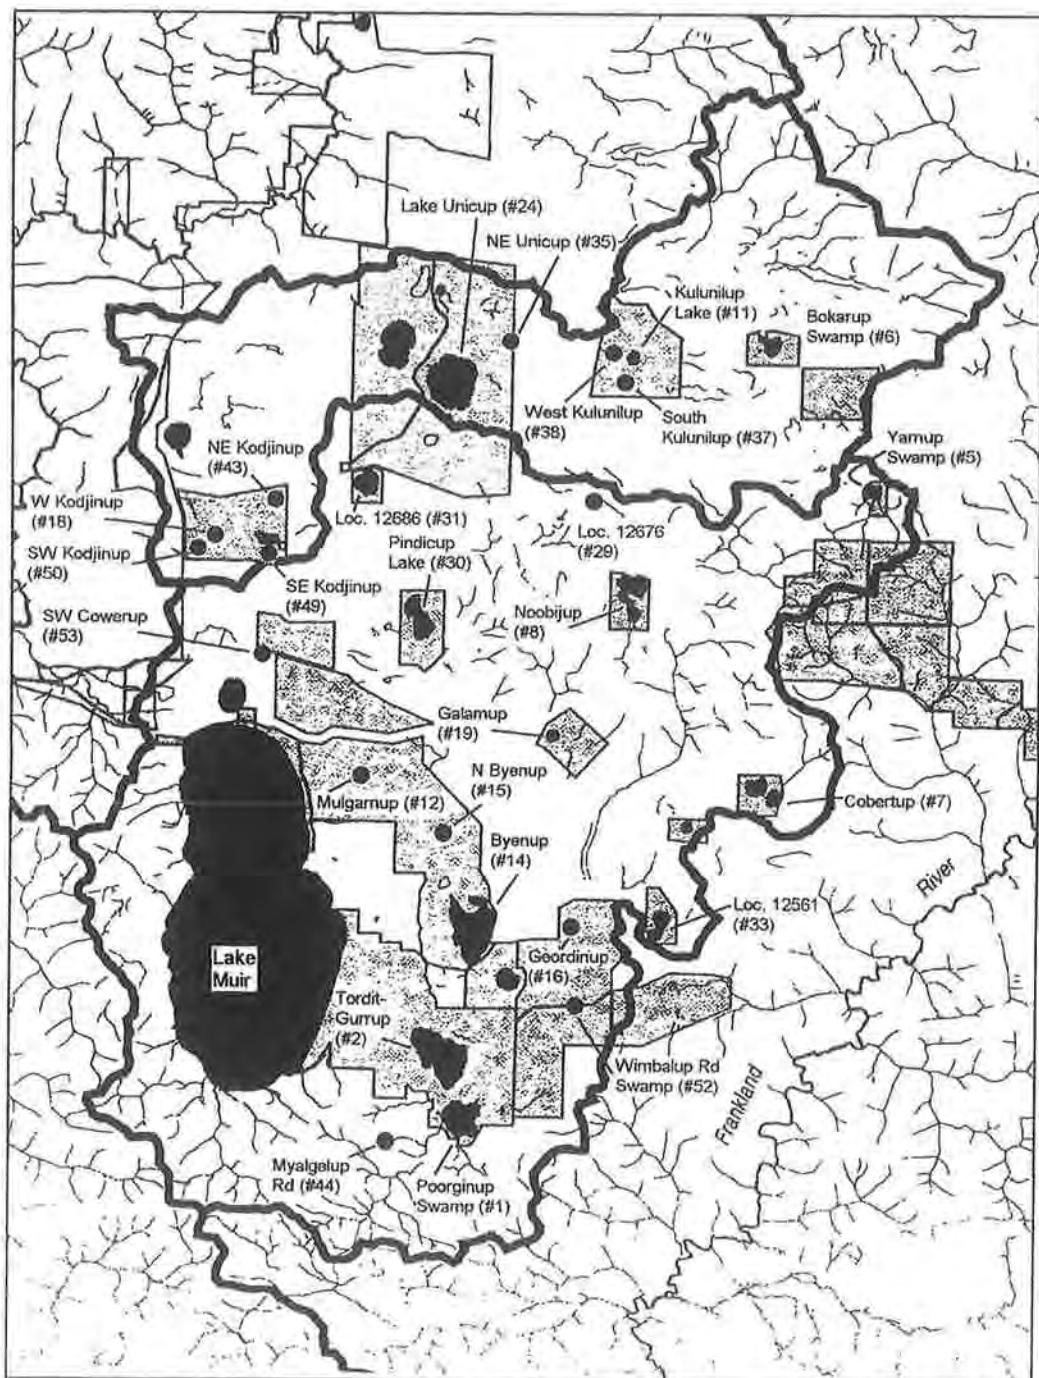

Figure 1 Location of the 13 Nature Reserves in the Muir - Byenup wetland system showing location of the 27 wetlands where permanent monitoring sites were established.

found over short distances relating to the blockage of major drainage patterns during the Tertiary and subsequent infilling of the plain (Chakravartula & Street 1999). The complex of vegetation patterning is also related to these patterns (particularly period of inundation, and quality of ground water) as well as fire history, although much detailed work would be required to demonstrate these correlations.

Table 2. Comparison of species richness of the Byenup - Muir wetland reserves with Fitzgerald River National Park and Lesueur National Park.

	Area (ha)	Number of taxa recorded .
13 Byenup - Muir wetland reserves	19 888	976
Fitzgerald River National Park	329 000	1883
Lesueur National Park	26 978	821

The area was remarkable for the number of threatened or poorly known taxa recorded (Table 1). Of particular note were *Euphrasia scabra*, *Lilaeopsis polyantha*, *Schoenus natans*, *Eryngium* sp. Lake Muir (E Wittwer 2293), and *Tribonanthes* sp. Lake Muir (GJK & NG 2387).

Euphrasia scabra and *Lilaeopsis polyantha* are only known in Western Australia from the Byenup - Lake Muir area. *E. scabra* was widespread in the eastern states but is now considered extinct in New South Wales and South Australia, many populations in Victoria and Tasmania have disappeared and the remaining ones are declining badly (Thompson 1992, Gilfedder & Kirkpatrick 1995, Gilfedder & Kirkpatrick 1996). Two large populations of this taxon were located during the course of this work, both appear in good health.

Schoenus natans is an aquatic sedge that was believed to be extinct until it was rediscovered on the Swan Coastal Plain in the early 1990s when it was listed as Declared Rare Flora (Keighery & Keighery 1996). It was subsequently found in a number of clay based wetlands on the plain and the adjacent Darling Scarp. During the present survey large populations of this taxon were found in five of the nature reserves. This taxon was subsequently taken off the DRF list.

Two taxa appear to be endemic to the Byenup - Muir wetland reserves *Eryngium* sp. Lake Muir (E Wittwer 2293), and *Tribonanthes* sp. Lake Muir (GJK & NG 2387). Both taxa occur on winter wet clay flats. While the *Eryngium* has been recognised for some time the *Tribonanthes* appears to be a previously unrecognised taxon. It is recommended that it be listed on CALM's priority flora list as a Priority 4 taxon, given its widespread occurrence in clay wetlands within the reserve system.

Vegetation

More than 30 different structural vegetation units were used to map nine nature reserves. The general pattern found was that of complex mosaics and gradational change as had been previously reported by Griffin (1984). Initially mapping was undertaken using the same map units as earlier mapping of Unicup, Kulunilup and Yarnup Nature Reserves (Griffin 1984). It was found that some of these units were too heterogenous to reliably map. Final map units chosen are generally comparable with the earlier work and correlations are made in relevant sections of Appendix 1.

Major vegetation patterning appears to be related to soil type, period of inundation, quality and type of ground water, and fire history. The complex hydrology of the area is evident in reserves such as Unicup where saline and freshwater plant communities can occur on the same wetland. The occurrence of a patch of *Baumea articulata* on the eastern side of Little Unicup in an otherwise saline lake implies the occurrence of a freshwater spring (Froend & McComb 1991). Similar patterning is seen in other lakes in Unicup and Pindicup Nature Reserves. In both these reserves saline wetlands (presumably in contact with saline ground water) and freshwater wetlands (presumably fed by perched aquifers) can occur within very short distances of each other.

Considerable change in vegetation communities can be noted since JAK Lane took a series of oblique aerial photographs of many of the reserves in 1980 (see Appendix 2). These changes have not been restricted to the margins of the basin wetlands but also affect damplands and sumplands (primarily wet heath communities).

Of the 10 basin wetlands dominated by *Baumea* sedgeland photographed in 1980 five (Cobertup, Kulunilup, Pindicup, Pinticup and Yarnup) show no obvious change when compared to recent aerial photographs. In three wetlands (Galamup, Kodjinup, and Noobijup) the density of the *Baumea* appears to have dropped but the area of open water shows little change. At Bokarup Swamp the cover of *Baumea* sedgeland has decreased by about 50 percent. Associated with this dramatic change is the almost complete replacement of a *Melaleuca lateritia* wet heath in the eastern wetland by open water. The 1980 photography shows the wet heath beginning to die from the centre of the wetland suggesting that rise in water table rather than fire has precipitated this change.

Lane's 1980 photography of Byenup Lagoon (Appendix 2) shows extensive areas of *Baumea* sedgeland in good condition interspersed by small patches of open water and clumps of *Melaleuca* forming small "islands". The October 1995 aerial photography appears to shows most of the *Baumea* on the western and north eastern side to be an orange colour which is indicative of stress. None of the other *Baumea* sedgelands in the Byenup - Muir wetlands shows this pattern on this series of air photographs. Recent

aerial inspections of the wetland (Jan 99) indicate the *Baumea* no longer appears stressed but does appear to less dense in some areas. Salinity levels reached an 8 year peak (and water levels an 8 year low) in Byenup Lagoon in 1995 (JAK Lane, pers. comm.). It is recommended that a time sequence of photography covering the period 1985 to 1999 be compiled to determine if the health of the *Baumea* sedgeland of Byenup Lagoon is correlated with salinity levels.

The seasonally inundated clay flats (sumplands) on the west side of Noobijup Nature Reserve also show severe impacts of a rising saline water table dating from 1980 (see Appendix 2). In the 1980 photography much of the private property on the eastern side of Noobijup had just been cleared and the wet clay flats were in excellent condition. Subsequent hydrological changes have resulted in significant death of both the tree and understorey layer in the reserve over an extensive area. Urgent remedial action is required to stop these impacts in the highly diverse Noobijup clay flats communities.

A salt scald has also developed on the west side of Yarnup Nature Reserve since 1980. Halse *et al.* (1993) reports that this was first observed about 1988. Surprisingly the October 1995 aerial photography shows no obvious change since 1980 in the density of the *Baumea* sedgeland in this reserve.

The observed changes seen in the *Baumea* sedgelands and wet heath communities are consistent with increases in salinity and / or water table depth (Froend & McComb 1991). The comparison of aerial photography is imprecise and subtle changes may not be apparent from these comparisons. What is clear is that there has been significant changes to a number of the wetlands since 1980 and in all cases this change has been toward wetland degradation.

Significant degradation has also occurred on the *Banksia ilicifolia* woodlands (damplands) in Kodjinup Nature Reserve since 1993 as the result of installation of an approved drain (CALM 1998, Appendix 2). The drains constructed through the central part have caused massive deaths of *Banksia ilicifolia* woodland and associated heath species as result of *Phytophthora* dieback spread (Map 4). This impact is being monitored by a series of photopoints (22 March 1997) laid along a 50m transect perpendicular to the drain (Appendix 2). Changes in inundation due to drain construction have also resulted in the death in small areas of Jarrah woodland (Map 4). The northern (upslope) section of the drain was constructed through what appear to be areas of old dieback infections.

The nature conservation values of Kodjinup Nature Reserve have been severely compromised by the construction of this drain. It is clear that detailed biological and *Phytophthora* dieback assessments should be made in the appropriate season before consideration is given to granting any approval to establish drains into any conservation reserve of the Byenup - Muir system. The dieback hazard of the low lying areas of the Byenup - Muir reserves system should be considered moderate - high. Extensive areas of death of *Banksia ilicifolia* woodland were also observed along the Muir Highway and on the southern boundary of Kodjinup Nature Reserve.

Some degraded vegetation was mapped at the southern end of Lake Muir (Map 5). This was investigated during the aerial survey of the Lake Muir vegetation and appears to be an *Armillaria* infection. This needs to be investigated further.

Vegetation monitoring

Baseline monitoring data were compiled from 47 quadrats in 27 wetlands (Appendix 3). The analysis of floristic variation in the 47 monitoring plots from the 27 wetlands (Table 3) showed distinct patterning related to wetland type, winter water depth and salinity. The first site group comprises plots in deeper water dominated by *Baumea articulata* and *Triglochin huegelii* (Tables 4 & 5). Within these the site at Poorginup (plot 1-1) is unusual in that it only shares *B. articulata* with other sites. This site was unusual in consisting of flooded mounds of organic material. The second site group consists of sites in shallow water at the edge of the basin wetlands. *Lepidosperma longitudinale* and *Melaleuca rhamphophylla* and sometimes *Melaleuca preissiana* are characteristic of these sites. (*Lepidosperma longitudinale* is also a common component of site group 3). Elements in species group A largely define these groups with species accumulation in site group 2 as a result of shorter inundation periods (Table 5). These two floristic communities grade into each other over an ecotone of 10 m or so in the field.

The third site group comprises the dense shrublands of long inundated seasonal wetlands. Species composition is somewhat variable but *Melaleuca densa* and *Lepidosperma longitudinale* are typical of

this group but not restricted to it (Table 5). The aquatic taxa typical of the basin wetlands (site groups 1 & 2) are almost entirely lacking. Species groups B & D are largely faithful to this group but with only moderately levels of constancy. Species group J consists almost entirely of singletons occurring in site 49-1.

One site (19-2) on the edge of Galamup Swamp is in the same position at the edge of the wetland as sites in site group 2 but was quite species poor and quite different species composition. This was the only site where *Villarsia albiflora* dominated the hermland around the waters edge.

Herb and rush dominated seasonally wet clay flats were only sampled at one site (38-1) in Kululinup Nature Reserve. Here *Apodasmia ceramophila* dominated the herb rich clay flat and species group I was largely confined to this site (Table 3). Interestingly *Schoenus natans* (an aquatic sedge) was recorded from this site. This species was considered to have a very restricted distribution on the uncleared clay flats of the Swan Coastal Plain and Scarp. In fact this species is widespread on the seasonally flooded clay flats Byenup - Lake Muir area.

Site group 6 is the wet heaths of the palusplain and floodplains. While these sites share species group C, each site also shows a significant number of singletons (species groups F, K, L, & M - Table 5). The final site group comprises sites of brackish / saline substrates, generally dominated by *Melaleuca cuticularis*, although this taxa also occurs in some of the wet heaths of site group 6.

High levels of heterogeneity can be seen in the analysis resulting at least in part from the low species richness found in some of the sites. Species richness varies dramatically between site groups, with the deep freshwater group having the lowest mean species richness and the wet heaths the highest (Table 6). One hundred and twenty two of the 176 taxa in the analysis only occur at a single site (69%), this number of singletons adds considerably to the observed heterogeneity. While further sampling is likely

to lower the number of singletons work on the Swan Coastal Plain (Gibson *et al.* 1994) and the Karri belt (Wardell-Johnson & Williams 1996) indicates that wetland vegetation, in particular, has a high component of naturally uncommon species. The reasons for this are poorly understood.

Table 6. Species richness by site group.

Site group	Species richness
1	3.6
2	11.0
3	12.2
4	7.0
5	14.0
6	28.3
7	7.3

Conclusions

The wetlands of the Byenup - Muir reserve system have very high conservation values in terms of total flora diversity, diversity of rare and priority taxa, and diversity of plant communities and their complex mosaic and gradational patterning. The study has shown that the flora of this area is not well known and with further survey work more species will be recorded, especially in Lake Muir Nature Reserve.

The Byenup - Muir wetland system is listed in the Directory of Important Wetlands in Australia (ANCA 1996) under Byenup Lagoon system (including 11 nature reserves) and Lake Muir listings. The flora and vegetation of the Byenup - Muir wetland system would meet at least four Ramsar Convention criteria for listing as Wetlands of International Importance (ANCA 1996). (*Criteria 1a* - is a particularly good representative example of natural or near natural wetland, characteristic of the appropriate biogeographical region; *Criteria 1d* - it is an example of a specific type of wetland, rare or unusual in the appropriate biogeographical region; *Criteria 2a* - it supports an appreciable assemblage of rare, vulnerable or endangered species or subspecies of plant or animal, or an appreciable number of individuals of any one or more of these species; *Criteria 2d* - it is of special value for one or more endemic plant or animal species or communities).

There has been significant degradation of some of the wetland areas in the Byenup - Muir system since 1980. The degradation has generally resulted from changes in the hydrological regime or as result of *Phytophthora* dieback. Changes in hydrological regime have resulted from a rising water table, presumably as a result of land clearance, or as a result of drainage works. The spread of *Phytophthora* dieback is correlated with drainage and road works.

The impacts of dieback spread in Kodjinup Nature Reserve since 1993 clearly show how drainage works can have a serious impact on the nature conservation values of a reserve in a short time period. Detailed biological survey and dieback mapping are essential before consideration is given to granting approval for any new drainage works in conservation reserves of the Byenup - Muir system.

The designation of the Muir - Unicup catchments as a recovery catchment under the Salinity Action Plan (Government of Western Australia 1996) should provide resources to protect and manage the very significant biodiversity values of this area into the future.

Appendix 1

Descriptions of 13 reserves of the Byenup - Muir reserve system.

Bokarup Nature Reserve

Reserve number: 14739

Class: A

Location: 34 20 09S 116 49 52E;

Land tenure : Nature Reserve

Purpose : Water & Conservation of flora and fauna

Area: 146 ha

Biological values

Flora: Three hundred and seventy one species have been recorded from the reserve (Table 1). These include four priority taxa (*Jacksonia sparsa* ms (Priority 3), *Schoenus benthamii* (Priority 3), *Schoenus natans* (Priority 4), *Villarsia submersa* (Priority 4)).

Vegetation description: Twelve vegetation units have been mapped on the reserve (Map 1).

- 1) **Jarrah - Marri forest and woodlands** on laterites and lateritic gravels cover most of the reserve. The understorey is diverse in shrub, herbs and grasses. Typical understorey shrubs include *Hibbertia* spp., *Leucopogon* spp. and peas such as *Bossiaea* spp., *Daviesia* spp. and *Gompholobium* spp.
- 2) **Jarrah - Marri open woodlands** occupy the sand dune between the large wetlands. Typical understorey species included *Phyllanthus calycinus* and *Hakea ruscifolia* with *Centrolepis* spp. and *Johnsonia* spp. being the common herbs.
- 3) **Melaleuca preissiana - Banksia littoralis woodland** occurred along the drainage lines on the western side of the reserve. *Pericalymma ellipticum* and *Lepidosperma longitudinale* were the dominant understorey species.
- 4) **Melaleuca preissiana - Eucalyptus rudis woodland** occurred on seasonally wet flats on the transition zones between the drainage lines and wetlands, and the Jarrah - Marri woodlands on the laterites. Again *Lepidosperma longitudinale* was the common understorey species.
- 5) **Melaleuca rhaphiophylla** low forest surrounds the major wetland on the eastern side of the reserve ,at western end of Bokarup Swamp and small swamp on the northern boundary. These areas are inundated for long periods in winter and spring and the dense overstorey precludes development of any significant understorey layer.
- 6) **Melaleuca rhaphiophylla** open woodland was found on less inundated areas than the previous unit. *Eucalyptus rudis* was also recorded from this community, while the understorey was generally dominated *Lepidosperma longitudinale* and/or *Pericalymma ellipticum*.
- 7) Wet heath along the south western shore of the eastern wetland. This unit was dominated by *Melaleuca lateritia* and once dominated this wetland. A visit in late summer showed the remains of an old post and rail fence line crossing the lake and extending into the upland vegetation on the eastern side of the lake.
- 8) **Baumea sedgeland** covered about half of Bokarup Swamp. This community was very species poor, with *Baumea articulata* dominating in deeper water and *Baumea vaginalis*, *B. juncea* and *Villarsia albiflora* co-dominating in shallows near shore.
- 9) **Acacia dealbata** thicket occurs near the northern boundary of Bokarup Swamp on the edge of the cleared area. This introduced species appears to be the result of early rehabilitation efforts. There was little understorey under the dense canopy.
- 10) **Revegetation** of mostly planted eucalypt occurs in the north west corner of the reserve.
- 11) **Cleared area** largely dominated by annual grasses occur in the same area as units 9 and 10. The northern end of the dune between the two major wetlands has also been cleared.
- 12) **Open water** dominates all of the eastern wetland and approximately half the Bokarup Swamp.

Vegetation change: Oblique air photos from April 1980 (Photo 1 & 2 - JAK Lane, unpub data) show the eastern wetland almost totally covered by a *Melaleuca lateritia* wet heath community, this is currently open water (Map 1). The heath appears to be dying from the centre in the 1980 photography. The same series of photos show Bokarup Swamp itself was fully covered with *Baumea* sedgeland approximately half of which is now open water. The only revegetation work obvious on the 1980 photography was the *Acacia dealbata* thicket.

Disturbance or threats: The cause of the major change in the wetland vegetation in this reserve is not clear but appears to have resulted a from rising water table. The occurrence of the *Acacia dealbata* thicket represents a significant potential weed threat and should be removed as soon as possible.

DEPARTMENT OF CONSERVATION AND LAND MANAGEMENT

Job Number: IMB 98017127

Cobertup Nature Reserve

Reserve number: 26681
Location: 34 27 23S 116 49 50E;
Land tenure : Nature Reserve
Purpose : Water & Conservation of flora and fauna
Area: 151 ha

Class: A

Biological values

Flora: Three hundred and seventy taxa were recorded from the reserve (Table 2). These include two priority taxa (*Apodasmia ceramophila* ms (Priority 2) and *Rhodanthe pyrethrum* (Priority 3)).

Vegetation description: Ten vegetation units have been mapped on the reserve (Map 2).

- 1) **Jarrah - Marri forest and woodland** on laterite occupies the higher ground in the north west, north east and south west corners of the reserve. The understorey is diverse in shrub, herbs and grasses. Typical understorey shrubs include *Hibbertia* spp., *Leucopogon* spp. and peas such as *Bossiaea* spp., *Daviesia* spp. and *Gompholobium* spp.
- 2) **Jarrah - Marri open woodland** occupies the dune areas around the major swamps. The understorey is dominated by species such as *Phyllanthus calycinus*, *Allocasuarina humilis*, *Desmocladus flexuosus*, *Hypolaena exsulca*, and *Lyginia barbata*, taxa typical of sandy substrates. Yate (*Eucalyptus occidentalis*) was common on ecotone between this unit and the clay flats (vegetation unit 8).
- 3) **Melaleuca preissiana woodland** occurs in the south eastern corner of the reserve. In the wettest areas *Banksia littoralis* is a co-dominant. Common understorey species include *Hakea varia*, *Gonocarpus paniculatus*, and *Hemarthria uncinata*. This area was recently burnt in a hot fire.
- 4) **Eucalyptus decipiens woodland** occurs on the northern boundary of the reserve, common elements in the understorey include *Xanthorrhoea preissii*, *Hypocalymma angustifolium*, and the sedges *Mesomelaena tetragona* and *Tetraria octandra*.
- 5) **Melaleuca rhaphiophylla woodland** occurs as a band around the major *Baumea* swamps and intergrades into *Melaleuca preissiana* woodland in the south east corner of the reserve. The dominant understorey species is *Lepidosperma longitudinale*.
- 6) **Melaleuca rhaphiophylla woodland over wet heath** has also recently been burnt but appears similar in species composition to vegetation unit 8 (heathland on clay flats) with an open overstorey of *Melaleuca rhaphiophylla*.
- 7) **Melaleuca lateritia - Hakea varia heath** has been recently burnt in a hot fire. Most shrubs were killed and are regenerating from seed. *Lepidosperma longitudinale* has resprouted and is the dominated species at this time.
- 8) **Heathland on clay flats** are variously dominated by *Melaleuca viminea*, *Melaleuca densa*, *Kunzea micrantha* and *Astartea* sp. over a very rich and diverse herb layer including taxa such as *Rhodanthe pyrethrum*, *Hyalosperma simplex*, *Caesia micrantha*, *Burchardia congesta*, *Wurmbea dioica*, *Goodenia mimuloides*, and *Tribonanthes* sp Lake Muir , rushes and annual sedges are also prolific in the understorey.
- 9) **Open Baumea sedgeland** occupy the western swamp, this community is very species poor being dominated by *Baumea articulata*. Other sedges occurring in this sedgeland include *Baumea arthrophylla* and *B. juncea*.
- 10) **Closed Baumea sedgeland** occupy the eastern swamp with essentially same species composition as vegetation unit 9, however *Baumea* spp. cover is denser.

Vegetation change: Oblique air photos from April 1980 (Photo 3, 4 & 5 - JAK Lane, unpub data) show that although there has been considerable vegetation clearance in the area around Cobertup Nature Reserve there is no obvious large scale changes to the vegetation.

Disturbance or threats: On the northern boundary where run off from a dam is providing extra nutrients on the clay flat there has been considerable weed invasion. Management of this run off is urgently needed. Further monitoring of the reserve is needed to determine if vegetation communities are stable given the recent nature clearance of the adjoining lands.

Cowerup Nature Reserve

Reserve number: 33455

Class: C

Location: 34 25 48S 116 25 00E;

Land tenure : Nature Reserve

Purpose : Conservation of flora and fauna

Area: 270 ha

Biological values

Flora: One hundred and eighty five taxa have been recorded for the reserve (Table 3). This is likely to seriously underestimate the total flora since only minimal sampling was undertaken when the annuals were conspicuous. Four priority taxa were found (*Rhodanthe pyrethriflora* (Priority 3), *Schoenus benthamii* (Priority 3), *Schoenus natans* (Priority 4), and *Villarsia submersa* (Priority 4)).

Vegetation description: Cowerup Nature Reserve adjoins the northern boundary of Lake Muir Nature Reserve. Consequently both reserves were mapped using the same vegetation units. Of the 30 units that occurred in Lake Muir Nature Reserve, eight were found in Cowerup Nature Reserve, one unit was too small to map (Map 5).

- 1) **Jarrah - Marri forest and woodland** on laterite and lateritic gravels occurred as small flat ridges in the sandy Jarrah - Marri woodlands and could not be distinguished from them on aerial photography. They occurred on the predominantly on the eastern boundary of the reserve. The understorey is typically diverse in shrub, herbs and grasses. Typical understorey shrubs include *Hibbertia* spp., *Leucopogon* spp. and peas such as *Bossiaea* spp., *Daviesia* spp. and *Gompholobium* spp.
- 2) **Jarrah - Marri open woodland** on sandy soils occurs widely in the eastern half of the reserve, common understorey storey species include *Hibbertia racemosa*, *Astrolobium baxteri*, *Leucopogon* spp., *Phyllanthus calycinus*, *Acacia pulchella*, *Jacksonia furcellata*. On wetter sites this community is replaced by Jarrah - Marri woodland over *Agonis* scrub (unit 3).
- 3) **Jarrah - Marri woodland over Agonis scrub** occurs along on seasonally wet flats, on slight sandy rises *Banksia ilicifolia* often becomes the dominant canopy species. Understorey development depends on density of the *Agonis* layer.
- 12) **Melaleuca cuticularis** woodland over wet heath forms a distinct unit in the south western corner of the reserve. The substrate is generally clayey and this unit is has a very rich and diverse annual herb layer. The Asteraceae, Centrolepidaceae, Cyperaceae, Orchidaceae, Stylidiaceae are well represented. Common perennial taxa include *Melaleuca* spp., *Kunzea micrantha* and the rushes *Apodasmia ceramophila*, *Meeboldina coangustata*, and *Meeboldina cana*.
- 14) **Melaleuca preissiana** woodland over wet heath occurs extensively along the wet drainage lines Understorey is variable in the wettest sites is generally dominated by *Pericalymma ellipticum*. On drier sites understorey is diverse with peas and Myrtaceae dominating. In the western side of the reserve *Banksia littoralis* takes over as the canopy dominant.
- 15) **Melaleuca rhaphiophylla** forest forms dense stands around the deepest wetland and in the wettest parts of the flats. The understorey is generally dominated by *Lepidosperma* spp. and *Baumea* spp. but where the canopy is more open a variety of shrubs such as *Hypocalymma angustifolium*, *Pericalymma ellipticum*, *Callistachys lanceolata*, *Banksia littoralis*, *Hakea sulcata* become common..
- 17) **Melaleuca densa - Melaleuca viminea** heath occupy drainage lines with sandy clay substrates. These areas are winter wet and dry slowly in late spring and early summer. In the Lake Muir reserve this type flat was characterised by aquatic taxa such as *Schoenus natans* and *Villarsia* spp. early in spring giving way to diverse herblands as the wetlands dry.
- 24) **Closed Baumea sedgeland** occupy basin wetlands, *Baumea articulata* is the dominate sedge over most of the wetland, while toward the edge *B. juncea* and *B. vaginalis* co-dominate.

Vegetation change: No photos were taken of this reserve in 1980.

Disturbance or threats: The land to the west of the reserve has been cleared for sometime. Aerial photography indicates this may have resulted in increased inundation in the wetlands on the western boundary. Recently a new fence and bund has been constructed along this property line. There has been some recent clearance on the south eastern boundary.

Galamup Nature Reserve

Reserve number: 6549

Class: A

Location: 34 26 35S 116 46 10E;

Land tenure : Nature Reserve

Purpose : Conservation of flora and fauna

Area: 222 ha

Biological values

Flora: Two hundred and ninety one taxa and one hybrid have been recorded for the reserve (Table 4). Eight priority taxa were found (*Caladenia starteorum* ms (Priority 2), *Cryptandra arbutiflora* subsp. *minor* (Priority 1), *Leucopogon lasiophyllum* (Priority 2), *Leucopogon tamariscinus* (Priority 2), *Pterostylis turfosa* (Priority 1), *Schoenus benthamii* (Priority 3), *Schoenus loliaceus* (Priority 2), *Stylium mimeticum* (Priority 3)). While the hybrid *Caladenia starteorum* x *splendens* was recorded only one of the presumed parent was seen.

Vegetation description: Fourteen vegetation units were mapped on the reserve (Map 3).

- 1) **Jarrah - Marri forest and woodland** is the dominant vegetation unit of the reserve, including a mixture of both sandy and lateritic substrates. The gentle topography did not allow different substrates to be mapped. The understorey was diverse and predominantly shrubby.
- 2) **Jarrah - Marri open woodland** on sandy soils in the central part of the reserve had understorey species typical of damplands. The most common of these included *Hypocalymma angustifolium*, *Kunzea micrantha*, *Pericalymma ellipticum*, *Viminaria juncea*, sedge and rushes were also common.
- 3) **Jarrah - Marri open woodland over wet heath** occurred along a drainage line on the north eastern side of the reserve, with an understorey of scattered *Melaleuca preissiana* and a dense ground layer of *Pericalymma ellipticum* and/or *Agonis parviceps* and sedges such as *Lyginia barbata*. It also occurs in the centre of the reserve where the *Agonis* forms a dense thicket.
- 4) **Eucalyptus decipiens woodland** occurs in the south eastern corner of the reserve and grades into vegetation unit 11 (heathland on clay flats). The woodland is extremely species rich with high diversity in shrubs and herbs. Seven species of *Stylium* were recorded.
- 5) **Melaleuca raphiophylla - Banksia littoralis woodland** occurs around the edge of Galamup Swamp. This unit is inundated during the winter and early spring.
- 6) **Melaleuca lateritia heath** occurs in a small basin wetland in the centre of the reserve. Taxa such as *Baumea articulata* and *Lepidosperma longitudinale* co-occur with *M. lateritia* and as the wetland dries diverse annual herland develops.
- 7) **Pericalymma elliptica - Lepidosperma longitudinale heath** dominates another small basin wetland in the centre of the reserve. This wetland has much lower species richness than vegetation unit 6. *Schoenus loliaceus* was recorded from this wetland. A few scattered *Banksia littoralis* are also found but most have been killed by fire.
- 8) **Hakea prostrata heath** occurs as a series narrow bands within the Jarrah - Marri woodland (vegetation unit 1) and appear to represent minor drainage features. Shrubs associated with damplands are typical of this unit as well sedges and annual herbs.
- 9) **Baumea sedgeland** dominates most of Galamup Swamp. *Baumea articulata* is dominant while toward the edge of the wetland *B. juncea* and *B. vaginalis* also occur. In the narrow transition zone between the swamp vegetation and the *Melaleuca raphiophylla - Banksia littoralis* woodland an unusual herb-sedgeland dominated by *Drosera glanduligera*, *Poranthera microphylla*, *B. juncea* and *Villarsia albiflora* was found.
- 10) **Agonis heath and scrub** occurred along a sandy drainage line in the northern part of the reserve. *Melaleuca thymoides* is a common element of this community.
- 11) **Wet heath on clay flats** occurs in the southern corner of the reserve. In terms of species composition it is very similar to vegetation unit 4 (*Eucalyptus decipiens* woodland) without the overstorey element.

- 12) **Wet heath** on sandy substrate occurs in the very centre of the reserve. This heath had a similar species composition to vegetation unit 3 (Jarrah - Marri woodland over wet heath) without the overstorey element.
- 13) **Disturbed areas** on the south western and north western sides have been used for gravel extraction while the area on the north eastern boundary is a wet flat degrading as a result of nutrient rich runoff from a dam across the fence line.
- 14) **Open water** occurs in the centre of Galamup Swamp.

Vegetation change: Oblique air photos from February and April 1980 (Photos 6, 7 & 8 - JAK Lane, unpub data) show a more dense *Baumea* sedgeland in Galamup Swamp. No obvious cause is apparent for this change.

Disturbance or threats: The changes to Galamup Swamp are of concern, as is the wet heath degradation on the north eastern boundary which is becoming badly weed invaded as a result of nutrient rich run off from a dam on private property. Further degradation of the wet heath can be expected unless this nutrient run off is controlled.

Kodjinup Nature Reserve

Reserve number: 26678

Class: A

Location: 34 23 07S 116 39 30E;

Land tenure : Nature Reserve

Purpose : Water & Conservation of flora and fauna

Area: 626 ha

Biological values

Flora: Three hundred and forty-one taxa and one hybrid have been recorded from the reserve (Table 5). This includes four priority taxa (*Jacksonia sparsa* ms (Priority 3), *Leucopogon tamariscinus* (Priority 2), *Schoenus benthamii* (Priority 3), *Stylium mimeticum* (Priority 3)). A hybrid swarm of *Kunzea recurva* x *sulphurea* and backcrosses to both parents can be seen in several places along the southern boundary of the reserve.

Vegetation description: Thirteen vegetation units were mapped in the reserve (Map 4).

- 1) **Jarra - Marri forest and woodland** occur on laterites and lateritic gravels on the western side of the reserve. The understorey is diverse in shrub, herbs and grasses. Typical understorey shrubs include *Hibbertia* spp., *Leucopogon* spp. and peas such as *Bossiaea* spp., *Daviesia* spp. and *Gompholobium* spp.
- 2) **Jarra - Marri open woodland** on sandy low lying soils are widespread in the northern and eastern parts of the reserve. The understorey is variable but includes species such as *Hibbertia racemosa*, *Andersonia caerulea*, *Astroloma baxteri*, *Leucopogon propinquus*, *Calytrix angulata* and *Melaleuca thymoides*. Where it is wettest, *Agonis parviceps* dominates. The herb layer is similarly diverse.
- 3) **Banksia ilicifolia - Jarrah woodland** occur commonly in the southern and western part of the reserve. This vegetation unit is a dampland with dominant understorey species including *Melaleuca thymoides*, *Kunzea recurva*, *Aotus intermedia*, *Pultenaea ochreata* and *Adenanthes obovatus*. In the wettest areas Jarrah disappears (Photo 8). This community grades into vegetation unit 6 (*Melaleuca preissiana - Banksia littoralis* woodland) which occupies somewhat wetter sites.
- 4) **Dieback affected Banksia ilicifolia - Jarrah woodland** a significant area of *Banksia ilicifolia* woodland has been destroyed by dieback in the south western corner of the reserve. Some trees are still standing dead, the understorey is dominated by *Pultenaea ochreata*.
- 5) **Melaleuca cuticularis woodland** occurs in the north eastern corner of the reserve. A well developed but variable herb and sedge layer develops under the *Melaleuca*. Obvious species include *Lepyrodia muirii*, *Gahnia trifida*, *Lepidosperma longitudinale*, *Cotula coronopifolia*, *Triglochin* spp., *Juncus* spp., *Tribonanthes* spp. and *Burchardia monantha*. Variability in understorey species appears to be correlated with variation in sand and clay content.
- 6) **Melaleuca preissiana - Banksia littoralis woodland** is common vegetation unit on low lying sandy areas, the understorey is quite variable depending on period of inundation. In the wettest areas *Pericalymma ellipticum* and *Lepidosperma longitudinale* form a dense understorey. In slightly drier sites this is replaced by an understorey dominated by *Melaleuca* spp. (often *M. densa*, *M. spathulata*, and *M. viminea*), *Kunzea recurva*, and *Viminaria juncea*.
- 7) **Melaleuca preissiana woodland over Agonis scrub** is a species poor unit where the understorey is dominated by dense stands of *Agonis parviceps*.
- 8) **Melaleuca raphiophylla low forest** occurs around the basin wetlands and drainage lines. This unit is generally species poor due to the dense canopy and the understorey is usually dominated by sedges (*Lepidosperma longitudinale*, *Baumea* spp.).
- 9) **Open Melaleuca raphiophylla low forest** has a richer understorey with sedges, shrubs (such as *Agonis linearifolia*, and *Aotus intermedia*) and herbs (such as *Villarsia albiflora*, *Samolus junceus*, and *Opercularia hispidula*).
- 10) **Open Baumea sedgeland** occurs over Kodjinup Swamp itself, *Baumea articulata* is the dominate sedge, while toward the edge *B. juncea* and *B. vaginalis* co-dominate.
- 11) **Closed Baumea sedgeland** occurs in the western basin wetland, and has an identical species composition to vegetation unit 10 but has a higher cover of the *Baumea* spp.
- 12) **Disturbed areas** associated with an old mill occurs on eastern side.
- 13) **Open water** occurs in small areas but may dry to hermland later in summer.

Vegetation change: Oblique air photos from April 1980 (Photo 9 - JAK Lane, unpub data) show that the *Baumea* in Kodjinup Swamp appears to have become less dense although expanses of open water are not yet apparent.

Disturbance or threats: Drain constructed through the central part of the reserve in 1993 (CALM 1998) has caused massive deaths of *Banksia ilicifolia* woodland and associated heath species as result of dieback spread. This impact is being monitored by a series of photopoints (22 March 1997) laid along a 50m transect perpendicular to the drain. At 10m intervals a photo has been taken toward the east parallel to the drain (Photos 10 - 15). All photopoints were marked with a fence dropper. Changes in inundation due to drain construction has resulted the death in small areas of Jarrah woodland (Map 4). The northern (upslope) section of the drain was constructed through what appear to be areas of old dieback infections. The nature conservation values of this reserve have been severely compromised by the construction of this drain.

A much smaller drain directs water in wetland vegetation on the southern boundary of the reserve (Photo 16), no impacts to the vegetation at this time.

Table 5 - Kodjinup Nature Reserve flora list

Anthericaceae											
Agrostocrinum scabrum	1

Kulunilup Nature Reserve

Reserve number: 26677

Class: A

Location: 34 20 05S 116 47 16E;

Land tenure : Nature Reserve

Purpose : Water & Conservation of flora and fauna

Area: 612 ha

Biological values

Flora: Using Griffin (1984) data as a basis, a flora list of 432 taxa was compiled from the reserve (Table 6). This included seven priority taxa (*Amphibromus vickeryae* (Priority 1), *Apodasmia ceramophila* ms (Priority 2), *Euchiton gymnocephalus* (Priority 3), *Phyllangium palustre* (Priority 2), *Rhodanthe pyrethrum* (Priority 3), *Schoenus natans* (Priority 4), *Villarsia submersa* (Priority 4)).

Vegetation description: Griffin (1984) mapped the reserve and described 11 vegetation units. Brief descriptions of these units are given below.

- 3(1) *Eucalyptus marginata* (Jarrah) Forest (Type 2) [bottom of lateritic ridges]. Jarrah / Marri forest at base of lateritic ridges, essentially similar to Kodjinup vegetation unit 1.
 - 3/9) *Eucalyptus marginata* (Jarrah) Forest (Type 2) / *Agonis parviceps* Thicket. Variable unit similar to Kodjinup vegetation unit 2, common on low lying sandy substrates.
 - 4/6) *Eucalyptus marginata* (Jarrah) - *E. wandoo* Forest / *Hakea prostrata* Low Scrub A. A variable unit dominated by Jarrah and / or Wandoo, occasionally Marri, over a *Hakea prostrata* - *Hypocalymma angustifolia* heath with sedges *Mesomelaena tetragona* and *M. stygia*. This unit occupies old sandy drainage lines.
 - 6) *Hakea prostrata* Low Scrub A Similar to unit 4/6 without the overstorey. Essentially same as Galamup vegetation unit 8.
 - 10) *Melaleuca preissiana* - *Banksia littoralis* Open Low Woodland A. A complex unit essentially similar to Kodjinup vegetation unit 6.
 - 12) *Melaleuca lateritia* Dense Low Heath Essentially similar to Galamup vegetation unit 6, these are small basin wetlands on loamy clays.
 - 13) *Melaleuca rhiphiophylla* Dense Low Forest B. Occurs as circular or ring shaped areas in centre of some basin wetlands. This unit is equivalent to Muir vegetation unit 15.
 - 19) *Baumea* Sedges. Occupying basin wetlands, essentially same as Kodjinup vegetation units 10 and 11.
 - 22) *Melaleuca viminea* Heath. Occurring on grey clayey soils, with a variable understorey of *Baumea* sp. and *Leptocarpus aristatus*.
 - 23) *Melaleuca spathulata* Complex. Very variable unit of poorly drained flats. Its composition depending on drainage conditions, in the wettest areas *M. spathulata* forms a dense heath, in the drier peripheral zones it is more similar to vegetation unit 10.
 - 24) *Leptocarpus* Sedges. Clay flats dominated by *Apodasmia ceramophila* ms. Griffin (1984) states that there are few herbs, however these winter wet flats have a diverse annual herb flora in spring and early summer as these seasonally inundated wetlands dry.
- Disturbed areas)** Not mapped by Griffin (1984) but used in compiling species lists.

Vegetation change: Oblique air photos from April 1980 (Photo 17 & 18 - JAK Lane, unpub data) show little change to the central wetland.

Disturbance or threats: Recent aerial photography and on the ground inspections show several major drains entering the reserve. Of particular concern is the impacts on the *Melaleuca spathulata* heath in the north eastern corner of the reserve. Presently the community is very open with large areas of bare ground. This may be the result of salinity, this needs to be investigated using a time series of aerial photography to determine if this is the case and, if so, the rate of spread of this impact.

Other major drains enter the reserve from the west and south. No obvious impacts from these drains are apparent at this time.

Lake Muir Reserve

Reserve number: 31880
Location: 34 29 08S 116 43 24E;
Land tenure : Nature Reserve
Purpose : Water & Conservation of flora and fauna
Area: 11,311 ha

Class: A

Biological values

Flora: Seven hundred and thirty-seven taxa and one hybrid were recorded from the reserve (Table 7). This list included three Declared Rare Flora (*Caladenia christineae* ms, *Caladenia harringtoniae*, *Diuris drummondii*) and 19 priority taxa (*Amphibromus vickeryae* (Priority 1), *Anthotium junciforme* (Priority 4), *Apodasmia ceramophila* ms (Priority 2), *Caladenia starteorum* ms (Priority 2), *Eryngium* sp. Lake Muir (E Wittwer 2293) (Priority 1), *Euchiton gymnocephalus* (Priority 3), *Euphrasia scabra* (Priority 2), *Jacksonia sparsa* ms (Priority 3), *Leucopogon tamariscinus* (Priority 2), *Lilaeopsis polyantha* (Priority 2), *Melaleuca pritzelii* (Priority 2), *Phyllangium palustre* (Priority 2), *Rhodanthe pyrethrum* (Priority 3), *Schoenus capillifolius* (Priority 2), *Schoenus natans* (Priority 4), *Stylium lepidum* (Priority 3), *Stylium rhipidium* (Priority 1), *Synaphea decumbens* (Priority 1), *Villarsia submersa* (Priority 4)).

Of these taxa *Eryngium* sp. Lake Muir (E Wittwer 2293) appears to be an endemic taxa to the Lake Muir area; the two large *Euphrasia scabra* are the only known extant locations for this taxa in WA, it has been recommended for listing as nationally critical based on population declines in the eastern states; the shrublands and forests surrounding Lake Muir contain the only known populations of *Lilaeopsis polyantha* in WA; the aquatic sedge *Schoenus natans* has recently been delisted as Declared Rare Flora based on the large population of this taxa in Lake Muir Nature Reserve and several other Nature Reserves in the area. It was previously believed to be restricted to the Swan Coastal Plain (Keighery & Keighery 1996)

Vegetation description: Thirty one vegetation units have been mapped in the reserve, wet heaths and scrubs predominate in the northern section of the reserve while eucalypt woodlands are more common in the south (Map 5).

- 1) **Jarrah - Marri forest and woodland** on laterite and lateritic gravels cover a small area in the south eastern corner of the reserve. The understorey is typically diverse in shrub, herbs and grasses. Typical understorey shrubs include *Hibbertia* spp., *Leucopogon* spp. and peas such as *Bossiaea* spp., *Daviesia* spp. and *Gompholobium* spp.
- 2) **Jarrah - Marri open woodland** on sandy soils occurs widely in the southern half of the reserve, common understorey species include *Hibbertia racemosa*, *Hibbertia subvaginata*, *Astroloba baxteri*, *Leucopogon* spp., *Phyllanthus calycinus*, *Acacia pulchella*, *Jacksonia furcellata*. There is generally a very rich and diverse herb layer and orchids are numerous early in the spring. Toward the northern part of the reserve, this vegetation unit is replaced by Jarrah - Yate woodlands (unit 4).
- 3) **Jarrah - Marri woodland over Agonis scrub** occurs along seasonally wet drainage lines and in the swales between the dunes to the east of Lake Muir. Typically the *Agonis* scrub is very dense with little or no other understorey.
- 4) **Jarrah - Yate woodland** occur on the large dune bordering the eastern side of Lake Muir and sandy flats in the northern part of the reserve. It is replaced by vegetation unit 3 (Jarrah - Marri woodlands on sand) Both units have very similar understorey composition. Where the Jarrah - Yate community has been grazed weed diversity is high.
- 5) **Jarrah woodland over Hakea oleifolia heath** occurs on the red dunes to the east of Poorginup Swamp. This soil unit was not seen elsewhere in the reserve.
- 6) **Eucalyptus decipiens woodland** similar to those occurring in Galamup and Cobertup Nature Reserves are found in a small area on the wet clayey flats north of the Muir Highway. *Allocasuarina lehmanniana*, *Allocasuarina microstachya*, *Leucopogon australis*, *Darwinia vestita*, and *Aotus intermedia* are common components of the understorey. There was also a rich and diverse herb and sedge layer.
- 7) **Eucalyptus rudis woodland** occurs in small patches on wet flats and small rises. The understorey is typical of seasonally inundated situations and includes *Anigozanthos*

- flavidus*, *Agonis parviceps*, *Kunzea ericifolia*, *Viminaria juncea*, *Hakea ceratophylla*, and *Hakea varia*. Orchids were common in this unit in early spring.
- 8) ***Eucalyptus rudos* woodland on sand dunes** occur on the eastern side of most of the basin wetlands. These woodlands tended to be quite weedy reflecting a history of past grazing. These *E. rudos* woodlands are replaced by Yate woodland (vegetation unit 31) on the fringing dunes of Lake Muir, understorey composition is essentially similar.
 - 9) ***Banksia ilicifolia* woodland** occurs in small patches along and to the north of the Muir Highway. Extensive areas of dieback are apparent. In dieback free areas a diverse understorey of peas, epacrids, and Myrtaceae is present. *Schoenus* spp. and *Mesomelaena tetragona* are also common.
 - 10) ***Melaleuca cuticularis* complex.** The wet flats in the northern half of the reserve are mostly covered by *Melaleuca* shrublands and / or woodlands in a complex mosaic. One of the most variable is the *Melaleuca cuticularis* complex, which ranges from woodland to very open woodland to wet heath with occasional *M. cuticularis* trees. Understorey is also variable, apparently related to period of inundation, but generally includes *Astartea* spp., *Melaleuca densa*, *Hypocalymma angustifolium*, *Hakea varia*, *Harperia lateriflora* and *Meeboldina cana*. The Lake Muir endemic *Eryngium* sp. Lake Muir is also found in this unit.
 - 11) ***Melaleuca cuticularis* woodland over Gahnia sedgeland** is a distinct unit occurring on the flats along the edge of Lake Muir. This unit is quite species poor.
 - 12) ***Melaleuca cuticularis* woodland over wet heath** forms a distinct unit in the south eastern part of the reserve. The substrate is generally clayey and this unit has a very rich and diverse annual herb layer. The Asteraceae, Centrolepidaceae, Cyperaceae, Orchidaceae, Stylidiaceae are well represented. Common perennial taxa include *Melaleuca* spp., *Kunzea micrantha* and the rushes *Apodasmia ceramophila*, *Meeboldina coangustata*, and *Meeboldina cana*.
 - 13) ***Melaleuca preissiana* - *Kunzea sulphurea* woodland** occurs as a small unit on drainage lines on the southern boundary of the reserve.
 - 14) ***Melaleuca preissiana* woodland over wet heath** occurs extensively north of the Muir Highway. Understorey is variable in the wettest sites is generally dominated by *Pericalymma ellipticum*. On drier sites understorey is diverse with peas and Myrtaceae dominating.
 - 15) ***Melaleuca raphiophylla* forest** forms dense stands around basin wetland and in the wettest parts of the flats. The understorey is generally dominated by *Lepidosperma* spp. and *Baumea* spp. but where the canopy is more open a variety of shrubs such as *Hypocalymma angustifolium*, *Pericalymma ellipticum*, *Callistachys lanceolata*, *Banksia littoralis*, *Hakea sulcata* become common..
 - 16) ***Melaleuca* - *Kunzea* scrub** occur on the clay flats near Wimbalup Swamp, dominant melaleucas include *M. viminalis*, *M. densa*, *M. ?spathulata*. The annual herb layer is again very diverse with an aquatic flora (eg *Schoenus natans*, *Villarsia submersa*) giving way to a sequence of annual Asteraceae, Centrolepidaceae, Cyperaceae and Stylidiaceae as the wetlands dries.
 - 17) ***Melaleuca densa* - *Melaleuca viminea* heath** was a widespread unit in the northern area of the reserve occupying both sandy and sandy clay substrates. These areas are winter wet and dry slowly in late spring and early summer. Aquatic taxa such as *Schoenus natans* and *Villarsia* spp. are widespread in early spring giving way to herbs as the wetlands dry. It was in this community that *Euphrasia scabra* was found, this was first collection made in WA since Morrison's collection from Yetemerup Spring (Stirling Range) in 1902. Two large populations were located and more populations could be expected to be found.
 - 18) ***Melaleuca densa* - *Melaleuca viminea* thicket** can develop long inundated sites, here diversity drops as the canopy closes over.
 - 19) **Mixed *Melaleuca* heath** occurs in low lying flats in the southern half of the reserve. Composition is variable *Sphaerolobium vimineum*, *Eutaxia virgata*, *Hakea ceratophylla*, *Aotus intermedia*, and *Calothamnus lateralis* are common. On small rises this unit intergrades with the sandy Jarrah unit (unit 2). In the wettest areas it give way to the wet heath unit (unit 21) often dominated by *Pericalymma ellipticum*. Units 17, 18 and 19 occupy similar positions in the landscape and may reflect differences in fire age and / or period of winter inundation.
 - 20) ***Hakea prostrata* heath** is a very small unit in Lake Muir but has essentially the same species composition to the same unit in Galamup Nature Reserve.

- 21) **Wet heath** occupy very wet sandy sites and are generally dominated by *Pericalymma ellipticum* and *Lepidosperma longitudinale*. On more clayey substrates this community grades into the *Melaleuca* shrublands (units 16 - 19). This unit is most common in the northern part of the reserve.
- 22) **Gahnia sedgeland** occurs in the shallow swales along the edge of Lake Muir, this community is very species poor being dominated by *Gahnia trifida*. This unit grades into unit 11.
- 23) **Open Baumea sedgeland** occupy basin wetlands. In the deeper water *Baumea articulata* is the sole dominate, closer to the shore *B. juncea* and *B. arthropylla*. Around the edge of these wetlands taxa such as *Utricularia australis*, *Cotula coronopifolia*, *Centrolepis polystygna*, *Juncus bufonius*, *Villarsia albiflora* and *Microtis atrata* can also be found.
- 24) **Closed Baumea sedgeland** occupy basin wetlands and is essentially similar to unit 23, however the *Baumea articulata* tends to be denser.
- 25) **Dying Baumea sedgeland**. The *Baumea articulata* in Byenup Lagoon appears to be dying on the aerial photography taken on the 23rd October 1995 (WA3619-5051). This photo shows most of the sedgeland to be bright orange in colour, generally indicative of stress. Recent aerial inspection found a recovery of the sedgeland but that the sedgeland now appears more open than in 1995. It is not clear to the cause of this apparent decline but it does coincide with a 10 year peak in salinity levels in the lagoon (JAK Lane, pers. comm.).
- 26) **Riparian vegetation** (not mapped). Incised creek lines had a narrow but distinctive vegetation unit associated with them, this unit was too small to map. The overstorey of *Agonis* or *Callistachys* with a dense shrub layer of *Brachysema melanopetalum*. The poorly collected orchid *Gastrodia lacista* was found in these habitats.
- 27) **Samphire flats** occur along the shore of Lake Muir between the shore and the *Gahnia* sedgeland. Common species include *Halosarcia indica*, *Halosarcia leptoclada*, *Sarcocornia quinqueflora*, *Suaeda australis* and *Wilsonia backhousei*.
- 28) **Cleared land** occurs on a portion of the reserve north west of Byenup Lagoon, this area is largely covered by pasture grasses and weeds, some revegetation of the shrub and tree layer is occurring. A block of private land west of Poarginup Swamp has previously been cleared, it is also slowly revegetating.
- 29) **Armillaria affected shrubland**. Part of the *Melaleuca preissiana* - *Kunzea sulphurea* woodland north of Poarginup Swamp appears to be affected by canker, possibly *Armillaria*. This needs further investigation.
- 30) **Open water** occurs on most of the larger basin wetlands.
- 31) **Yate woodland on sand dunes** replace the more widespread fringing *E. rufidis* woodlands (vegetation unit 8) on the eastern shore of Lake Muir.

Vegetation change: The three images of wetlands to the east of Lake Muir from April 1980 (Photo 19 - JAK Lane, unpub data) show little change with recent aerial photography. The photo of Byenup Lagoon (Photo 20 - JAK Lane, unpub data) shows healthy *Baumea* sedgeland, dense around open water and more interspersed with clumps of *Melaleuca* and small patches of open water away from the major water body. As outlined above (vegetation unit 25) 1995 aerial photography appears to show the *Baumea* in a very stressed condition. Recent aerial survey indicates the *Baumea* sedgeland is in good condition but appears to have become more open.

Disturbance or threats:

- a) Drainage patterns and salinity levels in Byenup Lagoon should be investigated as a matter of priority in an attempt to identify the cause of the apparent collapse of the *Baumea* sedgeland in this wetland. A time series of aerial photos should be assembled to confirm if the health of the *Baumea* sedgeland is correlated with salinity levels. If this proves to be the case then management of salt loads in the lagoon would need to be kept well below the 1995 levels.
- b) A series of illegal drains have been constructed into the eastern side reserve during the course of this study. Significant impacts due to salinity and changes to inundation period could be expected.
- c) The private land block west of Poarginup Swamp should be acquired to protect Tordit-Gurrup Lagoon and Poarginup Swamp, these are two of the wetland systems in the best condition within the Lake Muir reserve. Any attempt to farm this land could put them at serious risk.
- d) Vegetation unit 29 needs investigation to determine if it is a result of fungal canker.

DEPARTMENT OF CONSERVATION AND LAND MANAGEMENT

Job Number: IMB 98017127

Noobijup Nature Reserve

Reserve number: 26680

Class: A

Location: 34 24 18S 116 47 11E;

Land tenure : Nature Reserve

Purpose : Water & Conservation of flora and fauna

Area: 183 ha

Biological values

Flora: Three hundred and forty eight taxa have been recorded from the reserve (Table 8) including four priority taxa (*Anthotium junciforme* (Priority 4), *Leucopogon tamariscinus* (Priority 2), *Rhodanthe pyrethriflora* (Priority 3), and *Villarsia submersa* (Priority 4)).

Vegetation description: Nine vegetation units have been mapped in the reserve. These include one clearly resulting from salinity and raised water tables (Map 6). More detailed vegetation mapping has recently been undertaken (D. Gardner, pers. comm.).

- 1) **Jarrah - Marri forest and woodland** on laterite occur in the south west and along the eastern boundary of the reserve. Species composition is similar to that described previously on this surface with a diverse understorey of shrub, herbs and grasses. Typical understorey shrubs include *Astroloba* spp., *Leucopogon* spp. and peas such as *Bossiaea* spp. and *Gompholobium* spp. *Xanthorrhoea gracilis*, *Thysanotus* spp. and *Dryandra armata* are also typical of this community.
- 2) **Jarrah - Marri open woodland on sand** occurs on the flats around the lake. Within this unit some minor lateritic ridges occur on the eastern side of the lake. Typical understorey elements include *Hakea ruscifolia*, *Hakea prostrata*, *Dryandra lindleyana*, *Hibbertia* spp., *Astroloba ciliatum*, *Mesomelaena tetragona*, *Lepidosperma* spp. and *Mesomelaena tetragona* and a diverse array of annual Asteraceae and Anthericaceae. Close to the lake edge *Agonis juniperina*, *Hypocalymma angustifolium*, *Pericalymma ellipticum* and *Lepidosperma longitudinale* become more common.
- 3) **Eucalyptus decipiens open woodland** occurs on the clayey soils in the north west corner of the reserve. This unit is essentially similar to that described for Lake Muir and Galamup Nature Reserves. The understorey is diverse in both shrubs and herbs and the dominants include *Calothamnus lateralis*, *Kunzea micrantha*, *Hakea varia* and *Daviesia incrassata*. The unit grades into the wet heath on clay flats (unit 6) which occupies the more water logged sites.
- 4) **Melaleuca rhaphiophylla - Eucalyptus rudis open woodland** occurs on a small wet flat near the eastern boundary of the reserve. The understorey is dominated by a pink weeping species of *Astartea* and *Calothamnus lateralis*.
- 5) **Melaleuca rhaphiophylla low forest** occurs as a narrow band on the eastern margin of the lake with *Lepidosperma longitudinale* being the dominant element in the understorey.
- 6) **Wet heath on clay flats** are floristically diverse both in terms of the shrub and herb layers. This unit is dominated by *Melaleuca densa*, *M. lateritica*, and *M. rhaphiophylla* and becomes inundated in winter. As the wetland dries aquatic species such as *Villarsia submersa*, and *Schoenus natans* dominate to be replaced by a diverse herband which includes *Rhodanthe pyrethriflora*, *Anthotium junciforme*, *Tribonanthes violacea*, *Trithuria bibracteata*, *Trithuria submersa*, *Polypompholyx multifida*, and *Utricularia inaequalis*. Perennial rushes are also a obvious component of this wetland (primarily *Leptocarpus tenax*, *Lepyrodia muirii* and *Meeboldina cana*). Three of the four priority taxa recorded for the reserve are found in this area. Rising water table and salt intrusion from the private property to the east is having a significant impact this vegetation.
- 7) **Open Baumea sedgeland** occurs in the northern portion of Lake Noobijup and is dominated by *Baumea articulata* in deeper water, closer to the shore *Triglochin huegelii* and *Villarsia albiflora* are also found. This vegetation unit is very species poor.
- 8) **Closed Baumea sedgeland** is essentially similar to unit 7, however the *Baumea articulata* tends to be denser.
- 9) **Salt affected vegetation** occurs on the western and southern edges of the reserve and is caused by rising watertable and increasing salinity coming off private property. Initially the herbaceous layer is killed followed by shrub layer and finally the tree cover. The area of

impact appears to be spreading north through the wet heath on the western side of the reserve.

Vegetation change: Oblique air photos from April 1980 (Photo 21 - JAK Lane, unpub data) show the firebreak along the western boundary had recently been cleared as had an area of bushland on the private property that has now been inundated by rising ground water. The area of wet heath that has subsequently destroyed by the rise in ground water (and increases in salinity) is in good condition in the 1980 photography. Further clearance along the western boundary has taken place since 1980. The *Baumea* sedgeland in Lake Noobijup appears to be denser in the 1980 photography. Permanent long term monitoring sites (as part of the Salinity Action Plan wetland monitoring program) have been set up in the Lake Noobijup Nature Reserve (Odgen & Froend 1998).

Disturbance or threats: Rising ground water on the western side of the reserve since clearance in 1980 has resulted in destruction of high diversity seasonal clay pan communities. The area impacted is continuing to increase. The vegetation in the Lake itself appears to be becoming less dense. It appears that saline water is entering the Lake from the south, the north (at times of high flow) and perhaps from the west via ground water.

Pindicup Nature Reserve

Reserve number: 26679

Class: A

Location: 34 24 49S 116 43 14E;

Land tenure : Nature Reserve

Purpose : Water & Conservation of flora and fauna

Area: 281 ha

Biological values

Flora: A total of 303 taxa, including three priority taxa (*Anthotium junciforme* (Priority 4), *Euchiton gymnocephalus* (Priority 3), *Leucopogon tamariscinus* (Priority 2)), have been recorded from the reserve (Table 9)

Vegetation description: Lake Pindicup is a naturally saline wetland and is the major feature in the Pindicup Nature Reserve, several small freshwater wetlands also occur in the reserve, the largest being Bodjinup Swamp located near the southern boundary of the reserve. Thirteen vegetation units have been recorded from the reserve (Map 8), with the disturbed areas (unit 13) and the areas of *Eucalyptus decipiens* woodlands (unit 6) being too small to show on the vegetation map.

- 1) **Jarrah - Marri forest and woodland** on laterite occur as a series of ridges on the western side of the reserve. In terms of species composition they are essentially similar to those described for Noobijup Nature Reserve. The understorey is typically diverse in both herbs and shrubs.
- 2) **Jarrah - Marri open woodland** on sand occurs in the valleys between the laterite ridges, along dunes on northern and eastern boundaries and on the flats to the west of the Lake. The vegetation is again essentially similar to the sandy Jarrah unit described for Noobijup Nature Reserve.
- 3) **Jarrah - Marri forest and woodland over Agonis scrub** occurred on the wet sandy flats in the north eastern corner of the reserve. This community had a understorey dominated by *Agonis parviceps* which can form dense thickets, where it was more open *Bossiaea praetermissa*, *Gompholobium confertum*, *Astroloma baxteri* were common as well as the sedges *Caustis* sp. Boyanup, *Lepidosperma squamatum* and *Anarthria scabra*. The collection of *Caustis* sp. Boyanup represents the most southern collection of this taxa.
- 4) **Melaleuca cuticularis woodland** occurs on the flats at the edge of the lake. This unit usually has an understorey of *Gahnia trifida*. Immediately adjacent to the lake the *Melaleuca* can drop out and the vegetation intergrades into a *Gahnia* sedgeland (unit 11). The inland boundary of this unit around the lake is some narrow ridges of *Eucalyptus decipiens* woodland (unit 6) running parallel to the shoreline, this unit was too narrow to map.
- 5) **Melaleuca preissiana - Banksia littoralis woodland** occupies sandy substrates in more low lying situations than the sandy Jarrah - Marri woodlands (unit 2). *Banksia ilicifolia* can occur as a co-dominant canopy species. Common components of the understorey include *Lepidosperma longitudinale*, *Baumea juncea*, *Agonis parviceps*, *Astartea* sp., *Calothamnus lateralis*, *Kunzea recurva* and in the wettest parts *Pericalymma ellipticum*. This unit intergrades with the wet heath unit (unit 7).
- 6) **Eucalyptus decipiens open woodland** as a narrow band around the edge of the lake immediately inland of the *Melaleuca cuticularis* woodland. South of the lake it occurs on narrow raised dunes at the inland side of the *Melaleuca cuticularis* flat. This community also occurs on the ecotone between the sandy Jarrah unit (unit 2) and the wet flats, in this situation it has a diverse understorey dominated by *Astartea* sp., *Melaleuca viminea*, and *Pericalymma ellipticum*.
- 7) **Melaleuca rhaphiophylla low forest** is the dominant vegetation on long seasonally inundated wetlands and the fringing unit around the freshwater basin wetlands. It is typically dense with a sparse understorey usually dominated by *Lepidosperma longitudinale*, in slightly more open areas *Melaleuca viminea*, *Aotus intermedia* and the perennial rushes *Meeboldina tephrina* and *Meeboldina royceri* are found.
- 8) **Wet heath dominated by Pericalymma ellipticum, Melaleuca viminea and Lepidosperma longitudinale** occupy the lowest lying areas outside the basin wetlands.
- 9) **Baumea articulata sedgeland** occurs along the south western edge of Lake Pindicup, in a small basin wetland immediately south of Lake Pindicup and in Bodjinup Swamp near the

southern boundary of the reserve. In the deepest sections *Baumea articulata* is the sole dominant while closer to the shore *Triglochin huegelii* becomes more apparent.

- 10) *Baumea vaginalis* sedgeland occurs on the lake floor and is flooded late into summer. The sedgeland generally monospecific stands of *B. vaginalis* although in some areas *B. arthrophylla* may dominate or co-dominate.
- 11) *Gahnia* sedgeland occurs on the flats on the eastern side of the lake. *Gahnia trifida* was the dominant taxon but species such as the shrubs *Thomasia grandiflora*, and *Grevillea ?diversifolia*, and the annuals *Cotula cotuloides*, *Gnephosis ?tenuissima*, *Vellereophyton dealbatum* were also common.
- 12) Lake bed was clayey and before it completely dried out was cover with an annual hermland primarily made up of *Myriophyllum verrucosum*. While the lake contained water *Lepilaena australis* was a common aquatic.
- 13) Disturbed areas are small and confined to areas near tracks and firebreaks, a series of weedy grasses and *Rumex* spp. were collected from these areas.

Vegetation change: Oblique air photos from February and April 1980 (Photo 22, 23 & 24 - JAK Lane, unpub data) show little change in the vegetation of Bodjinup Swamp or Lake Pindicup itself.

Disturbance or threats: No immediate threat is apparent but 1995 aerial photo shows further recent clearance.

Pinticup Nature Reserve

Reserve number: 26682

Class: A

Location: 34 27 59S 116 48 27E;

Land tenure : Nature Reserve

Purpose : Water & Conservation of flora and fauna

Area: 75 ha

Biological values

Flora: A total of 297 taxa have been recorded from the reserve (Table 10). This included six priority taxa (*Anthotium junciforme* (Priority 4), *Apodasmia ceramophila* ms (Priority 2), *Jacksonia sparsa* ms (Priority 3), *Rhodanthe pyrethrum* (Priority 3), *Stylidium mimeticum* (Priority 3), *Villarsia submersa* (Priority 4)).

Vegetation description: Fourteen vegetation units were identified in Pinticup Nature Reserve, two of these (Jarrah - Marri woodland on laterite - unit 13; and the disturbed areas - unit 14) were too small to map (Map 9).

- 1) **Jarrah - Marri open woodland** on sand occurs on the sandy rises and the better drained flats. This community is essentially similar to sandy Jarrah - Marri in Gamalup and Noobijup Nature Reserves. The understorey being diverse in shrubs and herbs with *Leucopogon* spp., *Acacia* spp., *Melaleuca thymoides*, *Gompholobium* spp. and *Hakea ruscifolia* being obvious components. In the dampest areas *Hypocalymma angustifolium* and *Kunzea micrantha* become more common.
- 2) **Logged Jarrah - Marri open woodland** on sand occurs near the western boundary of the reserve. The result has been an opening up of the canopy, species composition is same as vegetation unit 1.
- 3) **Jarrah - Marri - Yate open woodland** occurs on the sand dune on the eastern side of Pinticup Swamp. It has a similar species composition to the Jarrah - Marri open woodland with the addition of Yate as a canopy co-dominant.
- 4) **Banksia ilicifolia** woodland occurs on poorly drained sandy flats in the western part of the reserve. Common understorey elements include *Adenanthes obovatus*, *Hakea sulcata*, *Brachysema melanopetalum* and *Lysinema ciliatum*. *Franklandia fucifolia* was also found in this unit. In the wettest sites this community grades into *Melaleuca preissiana* - *Banksia littoralis* woodland (vegetation unit 6).
- 5) **Melaleuca cuticularis** woodland occupies most of a small basin wetland in the north west of the reserve. The understorey is dominated by *Gahnia trifida* with other common taxa including *Astartea*, *Melaleuca lateritia*, *Melaleuca viminea*, *Chaetanthus aristatus*, and *Meeboldina cana*. The soil in this area having a higher clay content than the surrounding areas.
- 6) **Melaleuca preissiana - Banksia littoralis** woodland occurs on the poorest drained areas of sandy soil. As a consequence the understorey is variously dominated by *Anigozanthos flavidus*, *Agonis juniperina*, *Calothamnus lateralis*, *Hypocalymma angustifolium*, *Melaleuca* spp. (including *Melaleuca densa* and *Melaleuca viminea*), *Pericalymma ellipticum*, *Hakea varia*, and the perennial rushes *Lepyrodia muiiri*, *Meeboldina tephrina*, *Tremulina tremula*. *Eucalyptus rudis* occasionally occurs in the canopy layer.
- 7) **Eucalyptus decipiens** open woodland occurs on the wet clay flats on the southern boundary of the reserve. It is a diverse community with rich shrub layer and large numbers of annual herbs as has been described for Noobijup Nature Reserve.
- 8) **Melaleuca rhaphiophylla** low forest occurs in areas of the longest inundation and as the fringing vegetation on the western shore of Pinticup Swamp. It typically has a sparse understorey of *Lepidosperma longitudinale*, *Baumea articulata*, *Baumea vaginalis*, *Villarsia albiflora*, and where gaps in canopy occur *Astartea fascicularis* and *Callistachys lanceolata* occur.
- 9) **Hakea prostrata** heath occurs in a small area in the south west corner of the reserve. This is an equivalent unit to that described in Galamup Nature Reserve.
- 10) **Wet heath** occurs on the wettest parts of the clay flats in the south eastern corner of the reserve. This flat is dominated by *Melaleuca* spp. and perennial rushes (*Apodasmia ceramophila* and *Harperia lateriflora*). In late winter the flats are completely flooded and aquatic taxa such as *Villarsia submersa* are conspicuous as the wetland dries a diverse suite

of annual herbs emerges. These include annual *Schoenus* spp., *Tribonanthes violacea*, and an array of orchids.

- 11) *Baumea* sedgeland occur in the two basin wetlands, the deepest parts being dominated by *Baumea articulata* while toward the shore *Triglochin huegelii* and *Villarsia albiflora* co-dominate.
- 12) *Lepidosperma longitudinale* sedgeland occurs in a small patch in the south west corner of the reserve in a winter wet drainage line.
- 13) Disturbed areas occur associated with firebreaks, these areas are too small to map but are a major source of weed concentration
- 14) Jarrah - Marri woodland on laterite occurs as small patches within the sandy Jarrah-Marri unit (vegetation unit 1). This unit was also too small to map but did show significant change in understorey species as has been described for other reserves.

Vegetation change: Oblique air photos from February and April 1980 (Photo 25 & 26 - JAK Lane, unpub data) showed no obvious changes in the vegetation.

Disturbance or threats: No obvious threat is apparent at this time, run off from tree farm which occur on three sides of the reserve should be monitored.

Quindinup Nature Reserve

Reserve number: 25506

Class: C

Location: 34 24 41S 116 52 41E;

Land tenure : Nature Reserve

Purpose : Conservation of flora and fauna

Area: 2653 ha

Biological values

Flora: A brief survey was undertaken of Quindinup Reserve, this found 276 taxa. This list should be considered preliminary (Table 11). One priority flora species (*Eucalyptus aspersa* (Priority 4)) were recorded from the reserve.

Vegetation description: No vegetation mapping was undertaken for this reserve. Six major habitat types were defined while compiling the flora list (Table 10).

- 1) ***Melaleuca rhaphiophylla* - *Melaleuca preissiana* woodland** along creek lines.
- 2) **Disturbed areas**
- 3) **Lateritic heath**
- 4) **Jarrah - Marri woodland on sand.**
- 5) **Jarrah - Marri woodland on laterite**
- 6) **Wandoor woodland.**

Vegetation change: This reserve was not photographed in 1980.

Disturbance or threats: Upland areas are in excellent condition. Increases in salinity in some of the creek lines is causing impacts to the riparian vegetation.

Unicup Nature Reserve

Reserve number: 25798

Class: A

Location: 34 21 35S 116 43 18E;

Land tenure : Nature Reserve

Purpose : Conservation of flora and fauna

Area: 3296 ha

Biological values

Flora: Using Griffin (1984) data as a basis, a flora list of 512 taxa was compiled from the reserve (Table 12). This included ten priority taxa (*Anthotium junciforme* (Priority 4), *Dryandra porrecta* (Priority 4), *Eucalyptus latens* (Priority 4), *Hibbertia silvestris* (Priority 4), *Opercularia rubioides* (Priority 2), *Pithocarpa corymbulosa* (Priority 2), *Schoenus loliaceus* (Priority 2), *Schoenus natans* (Priority 4), *Stylidium mimeticum* (Priority 3), *Synaphea decumbens* (Priority 1)).

Vegetation description: Griffin (1984) mapped the reserve and described 12 vegetation units. Brief descriptions of these units are given below.

- 2) ***Eucalyptus marginata* (Jarrah) Forest (Type 1).** Jarrah / Marri forest of the top and upper slopes of the lateritic ridges.
- 3/9) ***Eucalyptus marginata* (Jarrah) Forest (Type 2) / *Agonis parviceps* Thicket.** Variable unit similar to Kodjinup vegetation unit 2, common on low lying sandy substrates.
- 5) ***Eucalyptus wandoo* Forest** occurs as small patches in Jarrah forest on loamy gravels or clayey soils.
- 7) ***Eucalyptus decipiens* Open Low Woodland B (Type 1)** occurs on loamy sand usually on terraces above drainage lines. It is essentially similar to the Lake Muir vegetation unit 6.
- 9) ***Agonis parviceps* Thicket.** A variable unit which may have an overstorey of Jarrah and / *Banksia ilicifolia*. Appears essentially similar to Muir vegetation unit 3.
- 10) ***Melaleuca preissiana* - *Banksia littoralis* Open Low Woodland A.** A complex unit essentially similar to Kodjinup vegetation unit 6.
- 12) ***Melaleuca lateritia* Dense Low Heath** Essentially similar to Galamup vegetation unit 6, these are small basin wetlands on loamy clays.
- 13). ***Melaleuca rhamphophylla* Dense Low Forest B.** Occurs as circular or ring shaped areas in centre of some basin wetlands. This unit is equivalent to Muir vegetation unit 15.
- 15) ***Melaleuca cuticularis* Complex.** *Melaleuca cuticularis* woodlands to forests with an understorey variously dominated by *Melaleuca densa*, *Kunzea recurva*, *Pericalymma ellipticum* or *Gahnia trifida* giving way to very little understoreys under the densest canopies
- 17) ***Halosarcia* - *Wilsonia* Mat Plants.** Form areas of hermland around several of the salt lakes. Similar in many respects to Muir vegetation unit 27.
- 19) ***Baumea* Sedges.** Occupying basin wetlands, essentially same as Kodjinup vegetation units 10 and 11.
- 24) ***Leptocarpus* Sedges.** Clay flats dominated by *Apodasmia ceramophila* ms. Griffin (1984) states that there are few herbs, however these winter wet flats have a diverse annual herb flora in spring and early summer as these seasonally inundated wetlands dry.
- Disturbed areas)** Not mapped by Griffin (1984) but used in compiling species lists.

Vegetation change: This reserve was not photographed in 1980.

Disturbance or threats: Inundation of small wetland on eastern side of reserve due to rising water table. Destruction of woodland communities on eastern boundary due to rising saline water table.

Yarnup Nature Reserve

Biological values

Flora: Using Griffin (1984) data as a basis, a flora list of 272 taxa was compiled from the reserve (Table 13). This included 3 priority taxa (*Euchiton gymnocephalus* (Priority 3), *Hydatella australis* (Priority 1), *Stylium mimeticum* (Priority 3))

Vegetation description: Griffin (1984) mapped the reserve and described six vegetation units. Brief descriptions of these units are given below.

- 2) ***Eucalyptus marginata* (Jarrah) Forest** (Type 1). Jarrah / Marri forest of the top and upper slopes of the lateritic ridges.

3/9) ***Eucalyptus marginata* (Jarrah) Forest** (Type 2) / ***Agonis parviceps* Thicket**. Variable unit similar to Kodjinup vegetation unit 2, common on low lying sandy substrates.

10) ***Melaleuca preissiana - Banksia littoralis* Open Low Woodland A**. A complex unit essentially similar to Kodjinup vegetation unit 6.

13). ***Melaleuca raphiophylla* Dense Low Forest B**. Occurs as circular or ring shaped areas in centre of some basin wetlands. This unit is equivalent to Muir vegetation unit 15.

17) ***Halosarcia - Wilsonia* Mat Plants**. Form areas of hermland around several of the salt lakes. Similar in many respects to Muir vegetation unit 27.

19) ***Baumea* Sedges**. Occupying basin wetlands, essentially same as Kodjinup vegetation units 10 and 11.

Disturbed areas) Not mapped by Griffis (1984) but used in compiling species lists.

Vegetation change: Oblique air photos from April 1980 (Photo 27 - JAK Lane, unpub data) shows extensive recent (1980) clearing to the south of the reserve. The area of salt scald crossing the road on the south side of the swamp is not visible on the 1980 photography. Halse *et al.* (1993) reported that the scat scalding had been noted since 1988. The area of open water visible in the swamp in 1980 is comparable to that mapped in 1984 Griffin and to the 1995 aerial photography (WA3619-5172).

Disturbance or threats: Death of woodland communities on western boundary, south of the swamp appears to be the result of saline run off from private property

Tremandraceae

- Platytheca galiooides*
- Tetratheca affinis*
- Tetratheca hirsuta*
- Tetratheca hispidissima*
- Tetratheca nuda*
- Tetratheca setigera*
- Tetratheca virgata*
- Tremandra diffusa*

Typhaceae

- Typha domingensis*
- * *Typha orientalis*

Urticaceae

- Parietaria debilis*

Violaceae

- Hybanthus debilissimus*
- Hybanthus floribundus*

Xanthorrhoeaceae

- Xanthorrhoea gracilis*
- Xanthorrhoea preissii*

Zamiaceae

- Macrozamia riedlei*

Zannichelliaceae

- Lepilaena australis*

Appendix 3

Monitoring site data

- Sites established 18-19 March 1997 & 20-28 October 1997, all sites visited on two occasions.
- Sites are 10 x 5 m plots with corners marked with galvanised fence droppers.
- Latitude & Longitude GPS fixes ($\pm 100\text{m}$).
- Semeniuk classification (Semeniuk & Semeniuk 1997)
 - Lake - permanently inundated basin
 - Sumpland - seasonally inundated basin
 - Floodplain - seasonally inundated flat
 - Palusplain - seasonally waterlogged flat
 - (* indicates inferred group)
- Ramsar classification (ANCA 1996)
 - B5 Permanent freshwater lakes ($>8 \text{ ha}$); includes large oxbow lakes
 - B8 Seasonal / intermittent saline lakes
 - B9 Permanent freshwater ponds ($<8 \text{ ha}$), marshes and swamps on inorganic soils; with emergent vegetation waterlogged for at least most of the growing season
 - B10 Seasonal / intermittent freshwater ponds and marshes on inorganic soils; includes sloughs, potholes; seasonally flooded meadows, sedge marshes
 - B12 Seasonal saline marshes
 - B13 Shrub swamps; shrub-dominated freshwater marsh, shrub carr, alder thicket on inorganic soils.
 - B14 Freshwater swamp forest; seasonally flooded forest, wooded swamps; on inorganic soils
 - B15 Peatlands; forest, shrub or open bogs
- Vegetation structural description of general area in which the plot is located (Muir 1977).
- Plot description include slope aspect and soil type.

01 Poorginup Swamp

Location: 34 30 38S 116 44 33E

Type(s):

Permanent/seasonal	- P
Semeniuk classification	- Sumpland
Ramsar classification	- B5, B15

Plot: 01-1

Vegetation: Emergent *Astartea fascicularis* open scrub, over *Baumea articulata*, *Meeboldina scariosa* open tall sedges.

Plot description: Flat with black clayey peat.

<i>Taxa</i>	<i>Cover (%)</i>
<i>Amperea volubilis</i>	<2
<i>Astartea fascicularis</i>	<2
<i>Baumea articulata</i>	10-30
<i>Meeboldina scariosa</i> MS	>70

02 Tordit-Gurrup Lagoon

Location: 34 31 36S 116 44 29E

Type(s):

- | | |
|-------------------------|-----------|
| Permanent/seasonal | - P |
| Semeniuk classification | - Lake |
| Ramsar classification | - B5, B15 |

Plot: 02-1

Vegetation: *Baumea juncea* open low sedges.

Plot description: Very gentle slope on washline with yellow sand and coffee rock.

<i>Taxa</i>	<i>Cover (%)</i>
<i>Baumea articulata</i>	<2
<i>Baumea juncea</i>	10-30
<i>Baumea</i> sp.	<2
<i>Chenopodium</i> sp.	<2

05 Yarnup Swamp

Location: 34 22 22S 116 51 40E

Type(s):

Permanent/seasonal	- P
Semeniuk classification	- Lake
Ramsar classification	- B9, B15

Plot: 05-1

Vegetation: Emergent *Melaleuca lateritia* open low woodland A, over *Triglochin huegelii* very open herbs, over *Baumea articulata* tall sedges.

Plot description: Flat with black peat.

Taxa	Cover (%)
<i>Baumea articulata</i>	30-70
<i>Melaleuca lateritia</i>	<2
<i>Triglochin huegelii</i>	2-10

Plot: 05-2

Vegetation: Emergent *Eucalyptus cornuta* open woodland, over *Melaleuca preissiana* open low woodland A, over *Hemarthria uncinata* very open grass, over *Baumea juncea* dense low sedges.

Plot description: Gentle lower slope with black sandy clay.

Taxa	Cover (%)
<i>Baumea articulata</i>	<2
<i>Baumea juncea</i>	>70
<i>Bossiaea linophylla</i>	2-10
<i>Epilobium billardierianum</i>	<2
<i>Eucalyptus calophylla</i>	<2
<i>Eucalyptus cornuta</i>	<2
<i>Hemarthria uncinata</i>	2-10
<i>Lepidosperma longitudinale</i>	<2
<i>Melaleuca preissiana</i>	2-10
<i>Myoporum caprarioides</i>	<2
<i>Opercularia hispidula</i>	<2
<i>Poa poiformis</i>	<2
<i>Samolus junceus</i>	<2
<i>Sollya heterophylla</i>	2-10
<i>Sonchus oleraceus</i>	<2
<i>Triglochin huegelii</i>	<2

06 Bokarup Swamp

Location: 34 19 59S 116 49 54E

Type(s):

- | | |
|-------------------------|----------------|
| Permanent/seasonal | - S |
| Semeniuk classification | - Sumpland* |
| Ramsar classification | - B5, B14, B15 |

Plot: 06-1

Vegetation: *Melaleuca rhamphophylla* open low woodland A, over *Baumea articulata* tall sedges, over *Baumea juncea* low sedges.

Plot description: Gentle lower slope with black peaty mud.

<i>Taxa</i>	<i>Cover(%)</i>
<i>Baumea articulata</i>	30-50
<i>Baumea juncea</i>	30-50
<i>Lepidosperma longitudinale</i>	<2
<i>Melaleuca rhamphophylla</i>	2-10
<i>Triglochin huegelii</i>	<2

07 Cobertup Swamp

Location: 34 27 27S 116 50 7E

Type(s):

- | | |
|-------------------------|------------|
| Permanent/seasonal | - ?P |
| Semeniuk classification | - Sumpland |
| Ramsar classification | - B13, B15 |

Plot: 07-1

Vegetation: Emergent *Triglochin huegelii* very open herbs, over *Baumea articulata*, *Baumea vaginalis* dense tall sedges.

Plot description: Flat with black peat.

<i>Taxa</i>	<i>Cover(%)</i>
<i>Baumea articulata</i>	30-70
<i>Baumea</i> sp.	2-10
<i>Baumea vaginalis</i>	30-70
<i>Triglochin huegelii</i>	<2

08 Noobijup Lake

Location: 34 23 53S 116 47 23E

Type(s):

Permanent/seasonal	- P
Semeniuk classification	- Sumpland
Ramsar classification	- B9, B15

Plot: 08-1

Vegetation: *Melaleuca rhaphiophylla* open low woodland A, over
Villarsia sp., *Triglochin huegelii* very open herbs, over
Baumea articulata tall sedges, over *Baumea juncea* very
open low sedges.

Plot description: Gentle lower slope with black clay.

<i>Taxa</i>	<i>Cover(%)</i>
<i>Baumea articulata</i>	30-70
<i>Baumea juncea</i>	2-10
<i>Melaleuca rhaphiophylla</i>	2-10
<i>Triglochin huegelii</i>	2-10
<i>Villarsia</i> sp.	2-10

Plot: 08-2

Vegetation: *Melaleuca rhaphiophylla*, *Eucalyptus calophylla*,
Callistachys lanceolata low forest A, over *Lepidosperma*
longitudinale tall sedges.

Plot description: Gentle lower slope with a S aspect, on black peaty sand.

<i>Taxa</i>	<i>Cover(%)</i>
<i>Baumea juncea</i>	10-30
<i>Callistachys lanceolata</i>	30-70
<i>Eucalyptus calophylla</i>	30-70
<i>Eucalyptus rufa</i>	<2
<i>Galium murale</i>	<2
<i>Lepidosperma longitudinale</i>	30-70
