Introduction

Woodland Watch is a woodlands conservation project launched in 2000 by WWF-Australia, in collaboration with the Herbarium of the Department of Conservation and Land Management, and with the assistance of funding from the Natural Heritage Trust and Alcoa Australia. One of the major objectives of the project was to carry out floristic surveys of selected remnant eucalypt woodlands of the Avon Wheatbelt region – on private farmlands and other lands not within the conservation estate. The Avon Wheatbelt bioregion is situated in the South West Botanical Province of Western Australia, which roughly corresponds to one of WWF's Global 200 priority ecoregions - the Southwest Australia Ecoregion. It is bound by Jarrah forest in the southwest, and the Eremaean Botanical Province –the Murchison and goldfields districts, to the northeast. It encompasses an area of 93,520 square kms, of which 93% has been cleared – predominantly for agriculture (Beard 1990).

Four woodland types considered by WWF-Australia to be amongst the most threatened eucalypt woodland communities of the Avon Wheatbelt region were selected for the research and conservation project: those dominated by salmon gum (*Eucalyptus salmonophloia*), gimlet (*E. salubris*), York gum (*E. loxophleba*) and red morrel (*E. longicornis*).

The primary aims of the project were to identify woodlands of high conservation value in the Avon Wheatbelt, to assist private landowners and rural communities to better manage and conserve these remnant woodlands, and to help landholders to better understand the major threats to these woodlands and their management needs. These include consideration of such impacts as soil compaction, and over-clearing and grazing, which have contributed to the secondary and more important problems of salinity and rising water tables.

Conducting flora surveys in these woodland communities was considered an essential preliminary activity, to highlight their uniqueness and diversity, and to assess and report on their condition. Using this and other information, property owners could then be advised on how best to manage and protect their remnant vegetation through fencing and other management practices, and conservation support schemes such as covenants. Thus, through Woodland Watch, it is possible to address some of the threats to the woodlands, including salinity. Future monitoring of the sites may provide data on the ability and rate at which these eucalypt woodlands can recover from disturbance.

The role of the WA Herbarium in this project was to survey, identify and voucher all plant specimens collected from selected woodland sites. In the first year (2000) it was proposed that 40 sites be surveyed over a two-year period. However, due to the positive response from the farming community it was possible to survey many more sites than was projected. In all, 41 sites were completed in the first year (2000) over a 10-week period. The following year (2001) another 21 sites were surveyed, bringing the total of sites surveyed to 62. Approximately 2400 vouchered specimens were collected.

Methodology

In 2000, the 41 sites were surveyed and plants vouchered by Robert Davis of the WA Herbarium, in collaboration with Richard McLellan of WWF-Australia. In 2001, the 21 sites were surveyed and plants vouchered by Robert Davis and Leigh Sage of the WA Herbarium, in collaboration with Carla Swift and Richard McLellan of WWF-Australia. The survey methodology for each site comprised three components:

Ten by ten metre quadrats

The location of each 10 x 10 metre quadrat was based on the area that best represented the species diversity of the selected woodland type. All species found were collected. Each quadrat was permanently marked by a steel stake on the north-western corner from which the coordinates were recorded using a GPS.

Random stratified collection

This involved a random walk covering the confines of the selected woodland, avoiding adjoining habitats to keep the integrity of survey purely to the targeted Eucalyptus woodland habitat.

Overall assessment

An overall assessment of the condition of each site was made using procedures adopted by the Wildflower Society of Western Australia (Trudgen 1991).

This methodology was considered the most effective to achieve the objectives of the project within the time constraints.

Results

Over a period 2000 - 2001, 62 sites were surveyed, resulting in the collection of approximately 2,400 specimens. Of the 62 woodland sites surveyed, 20 were *Eucalyptus loxophleba*, 20 *Eucalyptus salmonophloia*, 11 *Eucalyptus salubris* and 5 *Eucalyptus longicornis*. The six remaining sites were predominantly of other woodland types: 2 *Eucalyptus wandoo*, 1 *Eucalyptus salicola*, 1 *Eucalyptus capillosa*, and two other mallee woodlands. These selected woodlands varied greatly in size from 20-30 hectares to several hundred hectares; they also varied in condition.

The number of species collected at each site varied considerably. Two sites were found to have the highest number of species of all the sites recorded: Site 6, an *Eucalyptus salmonophloia* woodland ENE of Calingiri, produced 65 voucher specimens. The same number of species was recorded for Site 17, a woodland of predominantly *Eucalyptus capillosa* with some *Eucalyptus salmonophloia*. The smallest collection was within a modified *Eucalyptus longicornis* woodland (Site 58) north of Merredin, at which only 11 specimens were vouchered.

Eucalyptus salmonophloia dominated sites had marginally the highest number of species per site. From the 20 *Eucalyptus salmonophloia* woodland sites surveyed, a total of 816 specimens were vouchered - at an average of 40.8 species per site. The same number of *Eucalyptus loxophleba* woodland sites were surveyed, with 805 specimens vouchered - at an average of 40 species per site.

The least diverse woodland type appeared to be the *Eucalyptus salubris* woodlands. Of the 11 sites surveyed, 347 specimens were collected at an average of 32 species per site. *Eucalyptus longicornis* was the most poorly represented of these woodland types, possibly due to the rarity of this woodland type or simply a matter of circumstances. Only five *Eucalyptus longicornis* woodlands were surveyed with 148 specimens vouchered - at an average of 30 species per site.

Both the distribution and floristic composition of these woodland types within the Avon Wheatbelt region of Western Australia are highly varied. Using databases maintained by the WA Herbarium, it is possible to plot the distribution of these woodland types. However, this will not yield the true distribution of the woodlands, as Herbarium records often reflect merely the presence of a species and thus may not represent a woodland type as such. But it provides a good first-level approximation. Of the many factors affecting the distribution of these woodlands, the most significant appears to be rainfall and soil type.

Eucalyptus loxophleba woodlands are really composed of two woodland types: *Eucalyptus loxophleba* subsp. *loxophleba*, which dominates the western edge of the Wheatbelt running in a southeast / north-westerly direction; and *Eucalyptus loxophleba* subsp. *lissophloia*, which runs in a similar direction but dominates the eastern edge of the Avon Wheatbelt region. The distribution of *Eucalyptus salubris* mirrors that of *Eucalyptus loxophleba* subsp. *lissophloia*. The best-represented woodland is *Eucalyptus salmonophloia*, located throughout much of the Avon Wheatbelt region, with the exception of the northern and southern extremities. *Eucalyptus longicornis* distribution is much like that of *E. salmonophloia* other than being slightly less prevalent in the northern extremities of the Avon Wheatbelt.

The surveys provided an insight into the macro vascular plant associations represented within these four major eucalypt woodland types. The woodlands surveyed showed a certain amount of uniformity in species collected. However, there

were many subtle changes in plant associations from the north to the south of the project area.

The flowering seasons in 2000 and 2001 were considered to be relatively poor due to the lack of winter rains in those years with corresponding early starts to summer. There was no rain recorded after the first week of September 2000 throughout the Wheatbelt region. It is likely that these weather conditions impacted on the number of collections made, as some plants may not have flowered in the study period and many of the herbaceous plants may not have germinated.

However, even after extensive surveying of areas over several flowering seasons there would still be a small percentage of plant species left unrecorded. Despite the season not being ideal, some significant novelties have already been recognised within the collections, and no doubt there will be further findings as the collection is more closely scrutinised.

Woodland Watch has already provided the WA Herbarium with several likely new species and an invaluable window onto the diversity within four of our major Wheatbelt woodlands.

Collections of note

Many collections of interest were made during the 2000 and 2001 Woodland Watch flora surveys. Whilst the majority of these collections provided small range extensions, a number were more significant. Some of these, including a number of possible new species, new locations of Priority taxa, and some of the more notable range extensions, are highlighted below.

Likely New Species

Eight (8) possible new species were collected on Woodland Watch sites during the 2000 and 2001 surveys. All require further study. These were:

- ***Bossiaea* sp.** (WW-38). This has been confirmed as an undescribed species by Dr Jim Ross, Chief Botanist, Royal Botanic Gardens, Melbourne (2002, pers. comm.) Even though unnamed, it is not uncommon.
- ***Bossiaea* sp.** (WW-17). A possible new species.
- ***Austrostipa* sp.** (WW-39). This possible new grass is characterised by its naked florets, found in two separate collections made at this site. This character is found in species belonging to the southeastern Australian subgenus *Tuberculatae* which has never before been recorded in Western Australia. Indeed, this collection closely matches an eastern Australian species, *Austrostipa oligostachya*.
- ***Eremophila* sp.** There were three separate collections of this genus worthy of note, one of which is a possibly undescribed species belonging to the *Eremophila glabra* complex.
- ***Acacia cochlocarpa***. A specimen thought to be of this species closely matches one gathered from a similar area of the Avon region by the Prussian collector Ludwig Preiss in 1840, represented in the WA Herbarium only by a photograph.
- ***Acacia* sp.** A new species closely related to *A. sclerophylla*.
- ***Dampiera* sp.** An undescribed species found near Brookton.
- ***Lepidosperma* sp.** See notes below concerning *Lepidosperma costale*.

Priority Taxa (confirmed)

Seven (7) new populations of DRF and Priority species were recorded during the 2000 and 2001 surveys:

- ***Austrostipa exilis.*** (WW-34). A Priority species (P2) - representing a significant range extension. It has previously never been recorded in the Avon Wheatbelt region.
- ***Acacia recurvata.*** (WW-13). Possible new population of a Declared Rare Flora (DRF) species at a disjunct location. The condition of the plant was poor, and this population requires further observation.
- ***Gastrolobium callistachyus.*** (WW-29). New population of a Priority Four (P4) species.
- ***Acacia sclerophylla var. teretiuscula.*** (WW-13). A Priority One (P1) species.
- ***Blennospora phlegmatocarpa.*** (WW-05). A Priority Two (P2) species.
- ***Lechenaultia galactites.*** New populations of a Priority Three (P3) species.
- ***Goodenia sp. Chiddarcooping.*** Relocation and collection from the type locality of a species recommended for Priority listing (P1).

Significant Range Extensions, etc.

Five (5) taxa with significant range extensions were recorded:

- ***Hakea nitida*.** (Frog Hakea). A significant range extension of approximately 100 kilometres north of known collections.
- ***Abutilon cryptopetalum*.** (WW-24). Range extension.
- ***Abutilon oxycarpum*.** (WW-14). Range extension
- ***Lepidosperma costale*.** Possibly a complex of three species. A detailed study of Type material is needed to confirm which is the true *L. costale*.
- ***Maireana marginata*.** Proved to be a common species in these woodlands. However, it had been a poorly collected species mainly due to its insignificant appearance. Prior to the Woodland Watch project there had been only 18 collections of this species, this collection has now more than doubled in just two years.

The *Acacia* specimens collected during the first two years of Woodland Watch have also assisted in the refinement of taxonomic data for the electronic key to this genus (Maslin, 2001).

Woodland Watch site 4 [Photo: Richard McLellan/WWF-Australia]

Conclusion

The woodlands surveyed in 2000 and 2001 were found to be largely comprised of species of the following plant families, arranged here in alphabetical order: Asteraceae, Amaranthaceae, Chenopodiaceae, Anthericaceae, Mimosaceae, Papilionaceae and Poaceae.

Although dominated by eucalypts, there are relatively few species of Myrtaceae within these woodlands except for the genus *Melaleuca*. Even though melaleucas were relatively common, they were frequently located either on the periphery of these woodlands or in small pockets within, often near granite or by watercourses and in winter wet depressions. There were four common species of *Melaleuca* found in these woodlands: *Melaleuca adnata*, *M. coronicarpa*, *M. acuminata* and *M. uncinata*.

Proteaceae was also poorly represented in these woodland types. Four species from this family were common. Three, *Hakea recurva*, *H. preissii* and *Grevillea paniculata* were commonly found in association in *Eucalyptus loxophleba* woodlands. *Grevillea huegelii* was commonly found in *Eucalyptus salmonophloia* woodlands.

A magnificent Wheatbelt woodland

- 7 *Eremophila drummondii*
- 8 *Ehrharta longiflora*
- 9 *Sclerolaena diacantha*
- 10 *Bromus rubens*
- 11 *Austrodanthonia acerosa*
- 12 *Waitzia acuminata*
- 13 *Mesembryanthemum nodiflorum*
- 14 *Calandrinia calyprata*
- 15 *Lolium rigidum*
- 16 *Ptilotus sp.*
- 17 *Trachymene ornata*
- 18 *Grevillea huegelii*
- 19 *Ptilotus divaricatus var. divaricatus*
- 20 *Olearia muelleri*
- 21 *Acacia sp.*
- 22 *Acacia sp.*
- 23 *Trymalium daphnifolium*
- 24 *Acacia acuaria*
- 25 *Santalum acuminatum*
- 26 *Austrodanthonia caespitosa*
- 27 *Lomandra effusa*
- 28 *Lepidosperma aff. costale*
- 29 *Hyalosperma glutinosum ssp. glutinosum*
- 30 *Wilsonia humilis*
- 31 *Brassica sp.*
- 32 *Acacia bidentata*
- 33 *Austrodanthonia caespitosa*
- 34 *Ptilotus spathulatus f spathulatus*

Site: WW-61 **No. of Species:** 36

Locality: Calingiri

Vegetation: *Eucalyptus salmonophloia* woodland.

- 1 *Eucalyptus salmonophloia*
- 2 *Acacia erinacea*
- 3 *Atriplex semibaccata*
- 4 *Austrostipa elegantissima*
- 5 *Austrostipa exilis P2*
- 6 *Austrodanthonia caespitosa*
- 7 *Ehrharta longiflora*
- 8 *Lepidium rotundum*
- 9 *Enchytraea lanata*

- 10 *Lomandra effusa*
- 11 *Ptilotus spathulatus f spathulatus*
- 12 *Maireana enchytraenoides*
- 13 *Maireana brevifolia*
- 14 *Podolepis capillaris*
- 15 *Rhodanthe polycephala*
- 16 *Arctotheca calendula*
- 17 *Hypochaeris glabra*
- 18 *Eucalyptus*
- 19 *Arthropodium ? dyeri*
- 20 *Lolium rigidum*
- 21 *Dampiera lavandulacea*
- 22 *Desmocladus asper*
- 23 *Scaevola spinescens*
- 24 *Ptilotus drummondii*
- 25 *Dianella revoluta*
- 26 *Goodenia convexa*
- 27 *Ursinia anthemoides*
- 28 *Avena barbata*
- 29 *Pentaschistis airoides*
- 30 *Stenanthesum tridentatum P4*
- 31 *Briza maxima*
- 32 *Bromus rubens*
- 34 *Hakea lissocarpa*
- 35 *Trachymene cyanopetala*
- 36 *Pelargonium havalasae*

Site: WW-62

No. of Species: 7

Locality: Calingiri

Vegetation: *Eucalyptus loxophleba* woodland.

- 1 *Eucalyptus loxophleba*
- 2 *Acacia acuminata*
- 3 *Dichopogon capillipes*
- 4 *Austrodanthonia caespitosa*
- 5 *Austrostipa elegantissima*
- 6 *Arthropodium dyeri*
- 7 *Avena barbata*
