## STANDARDS ASSOCIATION OF AUSTRALIA. NOMENCLATURE OF AUSTRALIAN TIMBERS.

- Part I. STANDARD TRADE COMMON NAMES.**
- Part II. STANDARD TRADE REFERENCE NAMES.**
- Part III. COMMON NAMES AND THEIR APPROPRIATE STANDARD TRADE COMMON NAMES AND STANDARD TRADE REFERENCE NAMES.**

### PREFACE.

The use of common names to indicate different timbers is a practice well established in the minds of the general public, particularly those engaged in the timber industry. From State to State, and indeed even from district to district, common names for the same timber may vary considerably. Furthermore, as well as some timbers being known by several common names, the same common name may frequently be used for several different timbers. For example several timbers which vary widely in properties are known as blue gum. Red gum and white gum are other names which have been applied to a number of different timbers. Consequently it is not possible to be sure of obtaining the required timber unless a botanical name is also used to define the timber. Of recent years the practice of including the botanical name in brackets has been adopted by some purchasers. This has led to a definite improvement in the position but it has been impossible to arrive at a fully satisfactory solution for three reasons.

The first of these is the splitting from time to time of a well known species into a number of new species, e.g. *Eucalyptus bicostata* Maid., Blakely & Simmonds has been split from *Eucalyptus globulus* Labill.. The second is the change of generic names, as the result of investigations into affinities of species showing that they should be allotted to another genus. The third reason, causing changes most exasperating to timber men, is brought about by the re-examination of early botanical records. In accordance with the International Rules of Botanical Nomenclature the specific name which is first used to describe a species must be retained. This has resulted in some old and well-known botanical names such as *Eucalyptus rostrata* Schlecht. being changed to *Eucalyptus camaldulensis* Dehn., and *Eucalyptus corymbosa* Sm., the well known red bloodwood, to *Eucalyptus gummifera* (Gaertn.) Hochr..

Eventually, the National Research Council set up a committee to try to devise a method of standardising names, but it was found impossible to arrive at a solution satisfactory to timber users, which did not contravene international botanical rules.

An attempt was also made at the International Botanical Congress in 1935 to obtain agreement to the conservation of well established specific names, but this was rejected. The Standards Association of Australia, at the request of timber associations, then took up the matter and referred it to its Timber Sectional Committee. This Committee and its various State branches have sought a solution, and after numerous attempts at satisfactory compromise, the following three lists have been prepared.

These three lists are headed thus :—

- Part I. STANDARD TRADE COMMON NAMES.**
- Part II. STANDARD TRADE REFERENCE NAMES.**
- Part III. COMMON NAMES AND THEIR APPROPRIATE STANDARD TRADE COMMON NAMES AND STANDARD TRADE REFERENCE NAMES.**

## PART I.

The primary aim of Part I. is to fix one common name for each of the most important commercial timbers in Australia. This name is called the Standard Trade Common Name, and Column 1 contains an alphabetically arranged list of these names. Column 2 shows their corresponding Standard Trade Reference Names. In Column 3 the botanical names of the tree or trees yielding timber which may be marketed under each standard trade common name are given.

It should be noted that in some instances two or more timbers of marked similarity have been given either the same standard trade common name (e.g., white beech), or names which partly correspond, e.g., *Flindersia bourjotiana*, *F. pubescens* and *F. schottiana* are all called SILVER ASH, but the distinguishing adjectives QUEENSLAND, NORTHERN and SOUTHERN respectively, have been provided to meet the requirements of those who wish to distinguish between them. Column 4 shows the States in which these trees grow and Column 5 shows the best known of any other names also used for each timber.

## PART II.

Part II. is primarily intended for commercial purposes to fix certain well-known botanical names as Standard Trade Reference Names. To facilitate the determination of the Standard Trade Reference Name from a botanical name for any timber the botanical names are arranged alphabetically in Column 1. These botanical names are accompanied by the name, abbreviation of name, or initials of the botanist who originally described the plant under that name. This mention of authorship may appear pedantic, but it is essential, since in some instances the same name has been used by as many as five different authors to describe five entirely different species.

In each case a description of the species is available for reference in botanical literature and notwithstanding any alterations of the species names which may be made by other botanists, it establishes for all time the link between the standard trade reference name and the description of the species by the botanist concerned. In future, whenever a botanical name is changed or a species is split, the new botanical names should be added to Column 1, but the Standard Trade Reference Name will remain unchanged. This arrangement has been adopted to meet trade interests without interfering with the botanist's sphere of activity.

In most instances the Standard Trade Reference Names agree with the current botanical name without the author's name. In other instances the Standard Trade Reference Name is the well established name of a species whose botanical name has recently been changed. In still other instances where the Standard Trade Common Name covers closely related timbers from two or more species which botanists consider distinct, one Standard Trade Reference Name covers that group of species.

It was considered that this part would be still more useful if one common name for each timber included were given.

Accordingly, when a timber has a Standard Trade Common Name listed in Part I., that name is printed in capitals in Column 3, but if it has no Standard Trade Common Name, the name by which it is probably best known is given in lower case letters, although of course it may have other names.

## PART III.

It is desirable that in future only the Standard Trade Common Names should be used and that the other names by which any timber is known should be allowed to fall into disuse, so that they may eventually become obsolete. However, since it is realised that for some time the alternative names may still be used an index which will reveal appropriate standard names seems desirable. Part III. is intended to serve this purpose. Column 1 contains common names, Column 2 the corresponding Standard Trade Common Names, if any, and Column 3, the corresponding Standard Trade Reference Names. For example, Murray red gum is not a Standard Trade Common Name, but reference to Part III. under Murray red gum ; or red gum,

Murray ; or gum, Murray red ; or gum, red, Murray, will reveal that the Standard Trade Common Name is RIVER RED GUM and the Standard Trade Reference Name is *Eucalyptus rostrata*. If one wishes to know its exact botanical identity, distribution and other names, these facts can then be obtained by reference to Part I under GUM, RED, RIVER. In some cases a name in Column 1 is followed by the name of a State in brackets. The purpose and proper interpretation of this is best explained by considering the example of Gum, Swamp (Tas.) on page 59. In determining the identity of a timber known as Swamp Gum, it could be said that in Tasmania this timber might be *Eucalyptus regnans* or some other species, but that in any other State it is almost certainly not *E. regnans*, whatever else it might be.

If a name does not appear in Part III., it belongs to one of the three classes—

- (a) Another, but less important alternative to a Standard Trade Common Name.
- (b) An alternative name for one of the timbers to which Standard Trade Reference Names, have been assigned, but which have not as yet been given Standard Trade Common Names.
- (c) A name of a timber not submitted for standardisation.

In consulting the lists it should be borne in mind that a bad but common everyday practice is to abbreviate common names. For instance, instead of NORTH QUEENSLAND KAURI the term "Queensland kauri," or simply "kauri," is often used. In general the name is reduced to the noun ; for example, any of the peppermints listed on pages 19 and 68 is likely to be called simply "peppermint." It was deemed advisable to bring such timbers together in Column 1 of Part I, and this has been done by printing each name in reverse order. In Part III each name is cross-referenced in every possible way, so that here again the peppermints, for example, appear together.

A few names are abbreviated in everyday speech by using the adjective only, for example, Bunya, hoop, King Billy, Mazlin's, miva, radiata and tarzali, but these names are usually distinctive.

It should be understood that in the case of a dispute as to the true name of a timber, the final criterion would be the true botanical name. Any timber which is given a standard name in this list can now be definitely linked to a botanical name and thus identified. At the same time, the confusion caused by the splitting of species or alterations to recognised names is avoided by the associated reference name which will remain unaltered.

In addition to timbers these lists contain the names of certain economic plants which for trade purposes should be standardised.

The thanks of the Association are especially due to officers of the Division of Forest Products, C.S.I.R., to the Inspector-General of Forests and the staff of the Commonwealth Forestry Bureau, and to the New South Wales Forestry Commission, Division of Wood Technology, who with the assistance of foresters in the other States, prepared the lists.

As one looks at these lists, it is hard to realise how much goodwill and desire to compromise as far as possible have been necessary in their preparation. There will doubtless be no difficulty in finding points on which the lists may be criticised. There may be omissions of names or of species and inclusions of others which will not please everyone. The adoption of the practice of using Standard Trade Common Names by all persons engaged in the production, marketing and use of timber will be very helpful to themselves, and will rapidly lead to the solution of an old problem.

#### NOTE.

Contrary to the botanical practice of using a capital letter for specific names adapted from the names of persons or genera, capitals have been omitted in such cases throughout these lists for the sake of uniformity and simplicity.

## PART I.

## STANDARD TRADE COMMON NAMES.

(List of timbers arranged in the alphabetical order of their Standard Trade Common Names.)

| Standard Trade<br>Common Name. | Standard Trade<br>Reference Name. | Botanical<br>Name.   | State in which<br>Occurring. | Other<br>Common Names.  |
