1 Introduction

Western Shield is a predator control and fauna recovery program initiated by the Department of Conservation and Land Management (CALM) in April 1996. The program is now run by the Department of Environment and Conservation (DEC).

An internal CALM document that outlined the objectives and implementation of *Western Shield* was first prepared in 1995 (see Burbidge *et al.* 1995). This document identified a network of “Fauna Reconstruction Sites” and “Species Recovery Sites” that would “ensure both the conservation of currently existing threatened mammals and the reconstruction... of the original mammal fauna”. It also provided a list of species that would benefit from this recovery program.

The mission, principles, priorities, objectives and strategies of *Western Shield* were formalised in the draft ‘*Western Shield* Fauna Recovery Strategic Plan July 1999 – June 2004 (CALM 1999). There was a focus on the recovery of extant fauna and on fauna reconstruction through translocation. The document provided an expanded list of proposed fauna reconstruction sites and species recovery sites by species and by CALM region.

A review document focusing on the Wheatbelt Region was prepared in 2001 with the aim of establishing translocation priorities for that region (see Orell, 2001).

This translocation plan aims to build on these documents and provide cost estimates for high priority translocations for the 2006/07 financial year. This plan will be reviewed annually.

Species considered in this translocation plan:

THREATENED SPECIES

Chuditch
Dibbler
Red-tailed phascogale
Numbat
Western barred bandicoot
Bilby
Western ringtail possum
Gilbert’s potoroo
Boodie (Shark Bay subspecies)
Boodie (Barrow Island subspecies)
Mala or Rufous hare-wallaby (Bernier/Dorre Island subspecies)
Mala or Rufous hare-wallaby (Tanami desert subspecies)
Mernine or Banded hare-wallaby
Black-flanked rock-wallaby
Quokka
Shark bay mouse
Heath mouse
Greater stick-nest rat
Western ground parrot
Noisy scrub-bird
Western bristlebird

Malleefowl

Western swamp tortoise
Orange-bellied frog
White bellied frog
Margaret River marron
Burrowing crayfish species
Cape Leeuwin freshwater snail

PRIORITY SPECIES

Quenda
Woylee
Tammar wallaby
Thick-billed grass-wren

NON-THREATENED SPECIES

Brushtail possum

This list of species includes species from animal groups not usually associated with the *Western Shield* program, such as frogs and invertebrates. The findings of the independent review of *Western Shield* determined that the scope of *Western Shield* should be better defined (Possingham *et al.* 2003). Wordings suggested by the panel was: “Feral predator control (where predators include foxes, cats and in particular cases rats and maybe even pigs) for the purpose of recovering remnant, and re-establishing new populations of critical weight range mammals and associated terrestrial vertebrates (eg reptiles, ground-nesting birds).” Whilst the predator control aspect of *Western Shield* may not be relevant to some of the species in this plan, other goals of the *Western Shield* program are relevant, such as fauna reconstruction and improving the conservation status of species. The procedures that have been developed (eg writing and approval of translocation proposals) for translocating species considered part of the *Western Shield* program are equally applicable to species more loosely associated with the program.

Maps have been produced for each species showing previous distribution, records from the Threatened and Priority Fauna Database and translocation sites. These maps are contained in Appendix II.

2 Changes in Conservation Status of Species under *Western Shield*

This section explores what is required to improve the conservation status of species as part of the *Western Shield* program. This translocation program will contribute to the actions required to delist species.

Western Australia is in a unique situation where conservation efforts in this state can have a huge influence on the conservation status of many species. Some species are endemic to Western Australia whilst others may have had a much wider distribution across Australia but the only extant populations now occur in Western Australia.

According to the IUCN, three rules govern the movement of taxa between categories. These are:

1. A taxon may be removed from a category of higher threat to a category of lower threat if none of the criteria of the higher threat category has been met for five years or more.
2. If the original classification is found to have been erroneous, the taxon may be transferred to the appropriate category or removed from the threatened categories altogether, without delay.
3. Transfer from categories of lower to higher risk should be made without delay.

Western Australia uses IUCN criteria to assign threat categories to species listed under Schedule 1 of the Wildlife Conservation Act. To remove a species from Schedule 1 therefore requires the species to no longer meet IUCN criteria for listing.

Listed below are examples of criteria that need to be met before a Vulnerable category species can be removed from Schedule 1 of the Wildlife Conservation Act:

- Population size has not declined by more than 30% over the last 10 years or 3 generations (whichever is longer).
- Extent of occurrence is greater than 20 000 km²
- Area of occupancy is greater than 2 000 km²
- Greater than five populations have persisted for more than five years.
- A population has contained greater than 1 000 individuals for more than five years.

It must be noted that maintaining a species conservation status at its current level is also a valid conservation achievement for many species.

The table only briefly comments on possible goals to be achieved based on the IUCN criteria under which they have been listed. Recovery Plans for the relevant species provide information in detail regarding recovery actions recommended for each species.

Species	2000 IUCN Listing	EPBC Act 1999	WC Act 1950	Action Plan	Goal for 5 years	Contribution of the 3 year translocation plan	Goal for 10 years	Goal for 15 years	Goal for 20 years	Goal for 25 years
Chuditch	Vu C1	Vu	S1 (Vu)	Vu C1	Greater than 10 000 individuals and a continuing decline of less than 10% over ten years or one generation (whichever is longer). Translocate to Francois Peron NP.	Possible translocation to Peron to establish a population in the arid zone.	Continue monitoring. Translocate for fauna reconstruction purposes targeting the arid zone (eg Lorna Glen). Animals may come from the wild or captive bred. If captive bred then the Perth Zoo colony needs to be reactivated.	R reintroduce to Dirk Hartog Island after prey species reintroduced and established on the island.		
Dibbler	En Bl + 2ce	EN	S1 (En)	En Bl + 2ce	Establish populations in large reserves (The species requires an extent of occurrence of greater than 5000km ² and an area of occupancy of greater than 500 km ² , to be downgraded from Endangered to Vulnerable).	Topping-up of the reintroduced population at Stirling Range NP will contribute to establishing a population that will extend the extent of occurrence and area of occupancy of the species on the mainland.	Establish populations in large reserves (eg coastal sites and Dirk Hartog Island)	Establish populations in large reserves (The species requires an extent of occurrence of greater than 20 000km ² and an area of occupancy of greater than 2 000 km ² , to be downgraded from Vulnerable to Priority 5).	Establish populations in large reserves.	Establish populations in large reserves.
Priority 5							Vulnerable	Vulnerable	Vulnerable	Vulnerable
Red-tailed Phascogale	En Bl + 2bd	En	S1 (Vu)	En Bl + 2bd	Establish additional populations in large reserves (The species requires an extent of occurrence of greater than 5000km ² and an area of occupancy of greater than 500 km ² , to be downgraded from Endangered to Vulnerable). Protect existing populations on small reserves from stochastic events (eg fire). Implement fire management in currently occupied and proposed translocation sites.	The proposed experimental translocation to Francois Peron NP could result in the establishment of a population in a large reserve outside the current wheatbelt range of the species.	Establish additional populations in large reserves. Implement fire management in currently occupied and proposed translocation sites.	Establish additional populations in large reserves. (The species requires an extent of occurrence of greater than 20 000km ² and an area of occupancy of greater than 2 000 km ² , to be downgraded from Vulnerable to Priority 5). Protect existing populations on small reserves from stochastic events (eg fire). Implement fire management in currently occupied and proposed translocation sites.	Establish additional populations in large reserves. (The species requires an extent of occurrence of greater than 20 000km ² and an area of occupancy of greater than 2 000 km ² , to be downgraded from Vulnerable to Priority 5). Protect existing populations on small reserves from stochastic events (eg fire). Implement fire management in currently occupied and proposed translocation sites.	Appropriate fire management of occupied reserves
Numbat	Vu A1a, D2	Vu	S1 (Vu)	Vu A1a, D2	Reassess ranking as may qualify for Endangered. Investigate ways of increasing ability to produce or access captive bred or wild animals for translocation. No change or upgrade to Endangered	Finish establishment of population in Stirling Range NP. Begin establishment of new population on South coast.	Continue monitoring. Establish greater than 5 populations or establish populations such that distribution is greater than 20 000km ² .	Continue monitoring. Establish greater than 5 populations or establish populations such that distribution is greater than 20 000km ² .	Vulnerable	Vulnerable

Species	2000 IUCN Listing	EPBC Act 1999	WC Act 1950	Action Plan	Goal for 5 years		Contribution of the 3 year translocation plan		Goal for 10 years		Goal for 15 years		Goal for 20 years		Goal for 25 years	
					SI	En B1 + 3a	En	(En)	The additional release of animals on Faure Island from Heirisson Prong will ensure that an additional secure, disease free population is established. If disease free status is maintained then it is possible that Faure Island may become a source of animals for translocation to other sites.	The species requires an extent of occurrence of greater than 5000km ² and an area of occupancy of greater than 500 km ² , to be downgraded from Endangered to Vulnerable	Establish population on Dirk Hartog Island. Translocation to the mainland is required to downgrade the conservation status of this species. The species requires an extent of occurrence of greater than 5000km ² and an area of occupancy of greater than 500 km ² , to be downgraded from Endangered to Vulnerable	The species requires an extent of occurrence of greater than 5000km ² and an area of occupancy of greater than 500 km ² , to be downgraded from Endangered to Vulnerable	Establish additional populations in large reserves (The species requires an extent of occurrence of greater than 2000km ² and an area of occupancy of greater than 2000 km ² , to be downgraded from Vulnerable to Priority 5)	Establish additional populations in large reserves (The species requires an extent of occurrence of greater than 2000km ² and an area of occupancy of greater than 2000 km ² , to be downgraded from Vulnerable to Priority 5)	Establish additional populations in large reserves (The species requires an extent of occurrence of greater than 2000km ² and an area of occupancy of greater than 2000 km ² , to be downgraded from Vulnerable to Priority 5)	Establish additional populations in large reserves (The species requires an extent of occurrence of greater than 2000km ² and an area of occupancy of greater than 2000 km ² , to be downgraded from Vulnerable to Priority 5)
Western Barred Bandicoot	En B1 + 3a	En	SI (En)	Continue work to resolve disease issues. Determine if vaccine can be developed for Western Barred Bandicoots. Determine if disease is species specific. The answers are required to determine appropriate source/s for translocations	No change	No change	No change	No change	No change	No change	No change	No change	No change	No change	No change	Priority 5
Bilby	Vu C 2a	Vu	SI (Vu)	Monitor reintroduced population at Francois Peron National Park to determine if the population size has reached 1000 individuals (Delisting requires a population to be established that contains greater than 1000 individuals). Delisting requires the total population of Bilbies to be greater than 10 000 mature individuals. This could be achieved by establishing at least five populations, each with greater than 2000 individuals. At least 100 individuals would be needed to establish each of these populations. Our capacity to breed bilbies would need to increase to achieve delisting within 10 years.	No change	No change	No change	No change	Translocate to large reserves and the arid zone (eg Lorna Glen, Lake Magenta NR, Stirling Range NP, Fitzgerald River NP, Perup, Kalbarri NP).	Translocate to large reserves and the arid zone (eg Lorna Glen, Lake Magenta NR, Stirling Range NP, Fitzgerald River NP, Perup, Kalbarri NP).	Translocate to large reserves and the arid zone (eg Lorna Glen, Lake Magenta NR, Stirling Range NP, Fitzgerald River NP, Perup, Kalbarri NP).	Translocate to large reserves and the arid zone (eg Lorna Glen, Lake Magenta NR, Stirling Range NP, Fitzgerald River NP, Perup, Kalbarri NP).	Translocate to large reserves and the arid zone (eg Lorna Glen, Lake Magenta NR, Stirling Range NP, Fitzgerald River NP, Perup, Kalbarri NP).	Translocate to large reserves and the arid zone (eg Lorna Glen, Lake Magenta NR, Stirling Range NP, Fitzgerald River NP, Perup, Kalbarri NP).	Translocate to large reserves and the arid zone (eg Lorna Glen, Lake Magenta NR, Stirling Range NP, Fitzgerald River NP, Perup, Kalbarri NP).	Translocate to large reserves and the arid zone (eg Lorna Glen, Lake Magenta NR, Stirling Range NP, Fitzgerald River NP, Perup, Kalbarri NP).

Working Western Shield Translocation Plan – September 2006

Species	2000 IUCN Listing	EPBC Act 1999	WC Act 1990	Action Plan	Goal for 5 years		Contribution of the 3 year translocation plan		Goal for 10 years		Goal for 15 years		Goal for 20 years		Goal for 25 years			
					SI (CR)	CR C2b, D	SI (VU)	Vu C2a (Vu)	SI (VU)	Vu C2a (Vu)	Progression of the establishment of a second population of this species that is secure from introduced predators.	Identify new release sites along West and South coast.	No change	No change	No change	No change		
Gilbert's Potoroos	CR C2b, D	Cr	SI (CR)	CR C2b, D	Continue monitoring and establishment of population on Bald Island. Continue work towards cross fostering experiments. Need to increase the capacity to breed/produce animals	To delist this species more than 10 000 mature individuals in the total population is required as well as a single population containing more than 1000 individuals. It is unlikely that the conservation status of this species could be improved given projections of development in the Busselton area and the predictions of climate change. The south coast fringe is likely to be important for the continued survival of the species.	No change	No change	No change	No change	No change	No change	No change	No change	No change	No change		
Western Ring-tail Possum	Vu C2a	Vu	SI (VU)	Vu C2a (Vu)	Aim for at least six populations to be known or established. A total of four populations are currently known (Bernier Island, Doree Island, Heinrich Prong and Faure Island).	Animals will be released into at least two new sites (Perup, Lake Magenta NR and/or Lorna Glen). It will be decided if Dryandra is a suitable site for this species (and therefore whether or not to continue releases at this site). If these populations are established for greater than five years then the species may qualify for delisting.	Reintroduce to Dirk Hartog Island. 3 Yearly Summary Tables

The following tables summarise translocations proposed for each species in each of the next three financial years. The plan is meant to be indicative only and it is expected that not all translocations proposed will be performed within the three years of the plan.

The schedule of releases is influenced by a number of factors. These factors include:

- The capacity of captive breeding facilities to produce the required numbers of animals for founding stock.
- The capacity of wild populations to sustain the removal of animals for translocation to other sites.
- The capacity of district or regional staff to undertake the work required.
- The desirability of “topping up” sites in consecutive years to ensure a good founding population size for establishment of a new population.
- Local environmental conditions providing adequate rainfall and plant growth to sustain translocated populations.
- The achievement of adequate feral animal control to protect translocated populations.

Translocations for each species are priority ranked (1 = highest priority, 2 = medium priority, 3 = low priority) for the first and second years of this plan. The highest priority translocations for the first year are costed in the next section of the plan.

2006 - 07

4 Costings for High Priority Translocations Proposed for 2006/07

4.1 Dibbler from Perth Zoo to Stirling Range National Park

TIMING: October 2006

This translocation will provide additional animals for the establishment of the population at Stirling Range National Park that began in 2004. This translocation is fully funded through a NRM project that finishes in 2007/08. The final release for the site is proposed for October 2007 after which monitoring results will determine if additional releases are considered appropriate in future years.

4.2 Red-tailed phascogale from wheatbelt reserves to Peron

TIMING: Autumn 2007

The translocation was postponed in 2004 following concerns regarding the palatability of cat baits to phascogales. The proposed Autumn 2007 release may be delayed until a bait with encapsulated 1080 is available. Despite the fact that neither chuditch nor northern quoll are affected by ground baiting (dried meat baits or Probait), field trials in 2004 indicated that 50% of wild red-tailed phascogales ate some portion of the Eradicat bait (which is the product used at Peron). Laboratory trials at the same time indicated that individuals were able to readily ingest sufficient bait to result in mortality based on the recorded LD50 for this species. If this translocation were to proceed in 2006/07 it would need to be considered an experimental release and concerns are likely to be expressed by the AEC. When it proceeds a commitment will be required to provide resources for possible additional releases and monitoring.

TOTAL FOR TRANSLOCATION				28 114	13 647

4.3 Numbat from Perth Zoo to a site on the south coast

TIMING: December 2006

It is proposed to select a new site on the south coast to establish a new population of numbats with the first release proposed for December 2006. This translocation is partially funded through NRM however it is estimated that an additional \$35 000 will be required each year to establish a new population on the south coast.

4.4 Bilby from RTD and Peron to Sunklands

TIMING: September 2006

Breeding facilities at Dryandra and Peron currently hold a full compliment of breeding stock. It is considered that sufficient bilbies have currently been released at Francois Peron National Park and into Dryandra woodland and so new release sites are required. A site has been selected at Perup but current concerns and research into the recent woylie declines in the area are likely to delay the release of any new species into the area until autumn 2007. It is proposed to select a site in the sunklands east of Nannup for a 2006 release. When this translocation proceeds a commitment will be required to provide resources for additional releases and monitoring. If a SWCC NRM funding application by the Narrogin District is unsuccessful then a further \$142 600 is required to fund a FTE to implement this translocation as well as translocations of Mala to Tutanning (2006/07) and Boodie to Dryandra (2006/07).

TOTAL FOR TRANSLOCATION				92 151	22 141

4.5 Western ringtail possum from Busselton/Bunbury development sites and carers to Leschenault, Yalgorup and Old Bunbury Rd area

TIMING: Continuous

These translocations will be undertaken to relocate possums displaced from development sites in the Busselton/Bunbury coastal strip. Primary funding for the translocations is an ARC linkage grant with CALM/DEC, Murdoch University and Sydney University (\$110 000 p.a.). Some costs will be recovered by charging developers (estimated ~\$40 000p.a.). Two PhD students are researching aspects of the reintroductions and are supported by scholarships through Murdoch University and DEC. A further \$5000 has been provided directly from the Director of Nature Conservation to fund these translocations for the 2006/07 financial year.

4.6 Gilberts potoroo from Mt Gardner and captive colony to Bald Island

TIMING: August 2006

This translocation will proceed subject to the success of previous releases. The establishment of a population on Bald Island will significantly improve the conservation status of the species. This project has received NRM funding and funding through the BCI.

4.7 Boodie from RTD to Dryandra

TIMING: September 2006

Boodies were first released into Dryandra Woodland in 2003. The translocation has had limited success to date. The release of additional animals in September 2006 will aim to bolster numbers and trial new release techniques. Funding provided by the Avon Catchment Council (ACC) will significantly contribute towards the costs of this translocation. If a SWCC NRM funding application by the Narrogin District is unsuccessful then a further \$142 600 is required to fund a

FTE to implement this translocation as well as translocations of Mala to Tutanning (2006/07) and bilbies to Perup/Sunklands/Lake Magenta (2006/07 and/or 2007/08).

4.8 Mala (Rufous Hare-wallaby) from RTD and Peron to Tutanning

TIMING: September 2006

Captive colonies of mala at Peron and RTD have bred a small number of numbers to provide founding stock for a possible translocation in 2006/07. A larger number of animals would be available for a release in the following year. Tutanning Nature Reserve has been selected for an experimental translocation of this highly cat sensitive species. Research activities at Tutanning Nature Reserve undertaken for the fully funded meso-predator project will contribute to the

monitoring of this translocation. Trapping of tammars for translocation to Nambung (see 3.18) may also provide additional information depending on timing. Funding provided by the Avon Catchment Council (ACC) will significantly contribute towards the costs of this translocation. If a SWCC NRM funding application by the Narrogin District is unsuccessful then a further \$142 600 is required to fund a FTE to implement this translocation as well as translocations of boodie to Dryandra (2006/07) and bilbies to Perup/Sunklands/Lake Magenta (2006/07 and/or 2007/08).

4.9 Mernine (Banded Hare-wallaby) from Peron to Faure Island

TIMING: May 2007

Banded hare-wallabies were first released onto Faure Island in 2004 with an additional release of animals in 2005. These releases involved animals sourced from the breeding program at Peron and a third release is proposed for May 2007. A translocation of animals from Bernier or Dorre Island in 2007/08 may be undertaken to further increase the founder population size used to establish the Faure Island population. These additional animals may be incorporated into the breeding program at Peron (for later release onto Faure Island) or released directly onto Faure Island. The transport and monitoring costs for the 2006/07 translocation will be borne by AWC. Other costs associated with the translocation are detailed below.

4.10 Black-flanked Rock-wallaby from Mount Caroline and Querekin to Cape Le Grand National Park

TIMING: May 2007

Rock-wallabies were first released at Cape Le Grand National Park in 2003 and additional animals were released in 2004 (total of 15 males and 17 females). Monitoring of the population so far has been encouraging with sightings 8km from the release site. The release of additional animals is proposed to increase the founder population size and alleviate problems caused by the species in wheatbelt reserves (eg grazing crops).

4.11 Black-flanked Rock-wallaby from Querekin to Paruna Sanctuary

TIMING: Spring 2006

This translocation will be undertaken to reduce the population size at Querekin (private property) following the completion of a fence that is being erected to resolve conflict between the farmer and the rock-wallabies. The translocation will also aim to fulfill an approved quota of 50 animals that was partially filled in December 2005 when 15 animals were translocated. AWC will cover costs of transport, release and monitoring of the animals. Other costs associated with the translocation are detailed below.

4.12 Greater Stick-nest Rat from St Peter Island, South Australia and Salutation Island to Faure Island and Salutation Island

TIMING: September 2006

This translocation will be undertaken jointly with Australian Wildlife Conservancy (AWC). Costs of the translocation will be shared between the organisations. This shared cost will include a reimbursement to the South Australian Department of Environment and Heritage for the collection and transport of the rats from St Peter Island. Funding has been applied for through the BCI.

4.13 Noisy scrub-bird from Mermaid/Waychinicup to Gull Rock and Porongurup NP

TIMING: May-July 2006

A small number (4) of birds were released into Porongurup National Park in June 2006. Additional releases are planned to establish a population in Porongurup NP and supplement the population at Gull Rock. Funding for Noisy scrub-bird translocations is currently provided through Project Phoenix.

4.14 Western Swamp Tortoise from Perth Zoo to Mogumber and Moore River Nature Reserve

TIMING: July 2007

The breeding program at Perth Zoo has bred sufficient numbers to provide animals for release. Some animals will be used to top-up the population being established at Mogumber and others will be used to establish a new population. A new release site in Moore River Nature Reserve has been selected. NHT funding is used to contract Gerald Kuchling to undertake the translocation and monitoring. Cost associated with the translocation would be \$4 000 salary, \$500 vehicle running and \$7 500 equipment/materials. Costs associated with monitoring would be \$40 000 salary, \$3 000 vehicle running and \$3 000 equipment/materials. Only minor costs associated with extra staff helping at the release are not covered by the NHT funding. The project was unsuccessful in obtaining BCI funding.

4.15 White-bellied frog from Witchcliffe area to other sites in Witchcliffe area.

TIMING: Spring 2006

This translocation will be undertaken to improve the conservation status of the species by supplementing the genetics of small existing populations or establishing new population within the species distribution. The translocation was not successful in receiving NRM funding but has been included in a BCI application that is yet to be assessed.

Estimated total cost = \$29000 (\$22000 salary/wages, \$4000 vehicle and \$3000 materials)

4.16 Quenda from Metro sites to Nambung National Park

TIMING: Continuous

This translocation will provide additional animals to sites in Nambung NP where animals were released in 2005 and 2006 (total of 43 males and 33 females). Costs for this translocation will be charged to the developer at full cost recovery + 42% on-costs. In addition to the regular Western Shield monitoring, trapping, will be undertaken by Jurien (Moora district) staff to target released animals.

4.17 Woylie from Karakamia to Nambung National Park and North Karlgarin Nature Reserve

TIMING: August 2006

The tranlocation of woylies from Karakamia to Nambung and North Karlgarin is likely to be undertaken at the same time. Woylies were first released into Nambung NP in 2004 with an additional release occurring in 2005 bringing the total founders to 64 (40 males, 24 females). The North Karlgarin NR population was started in 2005 with 40 woylies (20 males, 20 females). It is recommended to increase the founding population size of both these populations. As part of the management of the population of woylies at Karakamia AWC has, in the past, offered excess animals to DEC for translocation. The cost of trapping woylies for this translocation will be borne by AWC. Other costs associated with the translocation are detailed in the table below. Both translocation are to locations that are trapped as part of the regular monitoring for Western Shield. Additional trapping may be undertaken by the Moora District to target released animals.

4.18 Tammar Wallabies from Tutanning to Nambung

TIMING: April 2007

Tammar wallabies were first released into Nambung National Park in 2004. Additional animals were released in 2005 and March 2006. A total of 70 tammars (37 males, 33 females) have been released so far but monitoring of the second release suggested heavy losses to predation. A release in April 2007 should result in a sufficient founding population size and therefore satisfy the need for additional releases unless future monitoring shows further action is required.

TOTAL FOR TRANSLOCATION				11 048	15 763

4.19 Brushtail Possum from Karakamia and Metro sites to Julimar

TIMING: Continuous

Costs for the translocation of brushtail possums from development sites to Julimar will be charged to the developer at full cost recovery + 42% on-costs. There will be no costs associated with the translocation of brushtail possums from Karakamia to Julimar as this will only be undertaken as opportunity arises when translocating woylies. Release sites are located in areas trapped regularly as part of the Western Shield program and no additional monitoring is planned to target released animals.

5 Summary of Cost Centres Responsible for Translocations Underway and Proposed

The following table (Table 1) provides a summary that makes it easy to look up which districts are contributing resources towards translocations that are proposed or underway. The table will assist planning and budgeting.

Releases of animals in consecutive years are generally undertaken to establish populations. Once animals have been released at a site there should be an ongoing commitment to monitor and add additional animals in subsequent years. The number of releases that are performed at a site depend on how many animals have been available for earlier releases and indications of survivorship of released animals. In general at least three years of releases are allocated to each translocation to a new site. The actual calendar year/s that the release year number refers to, will depend on factors such as availability of animals and the priority given to the release site.

Table 1: Summary of cost centres responsible for translocations underway and proposed.

Note 1: “X”’s may be replaced by cost estimate if/when available.

Note 2: Release year indicates how many years animals have been or will be released at a site. For example a ‘3’ in the release year column indicates it will be the third year that animals have been released at that site.

6 Future Site-based Reintroduction Projects

6.1 Lorna Glen

The Lorna Glen-Earaheedy complex (Goldfields Region) has been identified as an arid zone fauna reconstruction site because of the diversity of landform systems, potential habitat types and the relatively good condition of these ex pastoral leases. Lorna Glen has been the study site for operation-scale feral cat and fox control. The project aims to demonstrate sustained control for three consecutive years with the view of reintroducing species in subsequent years. The first releases are planned for July 2007 (bilby, brushtail possum and boodie).

6.2 Dirk Hartog Island

Dirk Hartog Island will become available in the near future for fauna reconstruction. A project proposal for Mammal Reconstruction on Dirk Hartog Island has been prepared by Keith Morris and Colleen Sims and has been appended to provide additional information (Appendix 1).

Dirk Hartog Island formerly supported at least 13 species of mammals, of which only three species still persist. It is proposed that following the eradication of sheep, goats and feral cats on the island there will be the opportunity to reintroduce at least 12 species of medium-sized mammals to the island. The first releases are proposed to occur in 2011/12 subject to the successful eradication of introduced species. However, some species will be sourced from captive breeding facilities (eg Rufous hare-wallaby and Banded hare-wallaby) and so captive breeding will begin in 2008/09.

The proposed time frame for reintroductions to the island falls largely outside the three year time-frame of this plan, however, it is useful to consider this site for future planning particularly for species that need to be bred in captivity.

6.3 Mt Gibson

A project is being undertaken by the Australian Wildlife Conservancy to erect a vermin proof fence around an approximate 1000 ha area of Mt Gibson station in the next 12 to 24 months. The exact size and location of the enclosure has not yet been finalised and will influence the list of potential species for reintroduction. Possible species for reintroduction include:

- Black-flanked rock-wallaby
- Bilby
- Boodie
- Woylie
- Banded hare-wallaby
- Rufous hare-wallaby
- Western barred bandicoot
- Numbat
- Chuditch
- Brushtail possum

SUMMARY

Dirk Hartog Island formerly supported at least 13 species of mammal of which only three species still persist. The island will shortly become available to the Western Australian government as conservation estate and this provides the opportunity to reconstruct the native mammal fauna of this island. It is proposed that, following the successful eradication of sheep, goats and feral cats, at least 12 species of medium-sized mammals will be reintroduced to the island. This reintroduction program will cost an estimated \$8.72 million and is planned to run from July 2008 to June 2022. Details of the species to be translocated and the budget required are provided.

INTRODUCTION

Dirk Hartog Island in the Shark Bay World Heritage Area is the largest island off the Western Australian coast (58 640a) (Abbott and Burbidge 1992) and once supported at least 13 species of native mammal. (Baynes 1990, McKenzie *et al.* 2000). Since the 1850s Dirk Hartog Island has been a pastoral lease, and grazed by sheep and goats. Cats and house mice were also introduced to the island. Captain Denham attempted to introduce rabbits in 1858, however this was unsuccessful (David 1995).

In 2005 the WA Government finalised arrangements with the pastoral lease holder to relinquish the lease and convert the island to a national park. This offers the opportunity to undertake removal and eradication programs for the feral cats, goats and sheep and if successful, to reconstruct the mammal fauna of the island. Once threatening processes have been controlled (in this case, introduced fauna) it has been demonstrated that mammal translocations to islands are more likely to be successful than translocations to mainland sites (Short *et al.* 1992).

Potentially Dirk Hartog Island could support one of the most diverse mammal assemblages in Australia, and contribute significantly to the long-term conservation of several threatened species. Mammal reconstruction will also contribute significantly to the restoration of the island's ecosystems through activities such as digging the soil and grazing / browsing vegetation.

PREVIOUS MAMMAL FAUNA

Thirteen species of native terrestrial mammal are known to have previously occurred on Dirk Hartog Island (Baynes 1990, McKenzie *et al.* 2000) (Table 1). This list is derived from knowledge of extant species, historic collections and a brief sub-fossil survey by Dr Alex Baynes. Of these, 10 species of medium-sized mammals are thought to be extinct on the island, although they do occur elsewhere. Only three, smaller sized species still occur on the island. In addition it is possible that the Banded Hare-wallaby (*Lagostrophus fasciatus*) and Rufous Hare-wallaby (*Lagorchestes hirsutus*) also occurred on the island – they both occur on nearby Bernier and Dorre Islands, and previously occurred on adjacent mainland areas. A more thorough sub-fossil survey by Dr Alex Baynes is proposed for July – September 2006, and this should resolve this issue, and perhaps find other species that once occurred on Dirk Hartog Island. For this proposal the hare-wallabies have been included as potential species for translocation. While this project is regarded primarily as a reconstruction project, it may be desirable to include species that did not previously occur on Dirk Hartog Island, but did occur in the Shark Bay area, if there are strong conservation reasons for doing so.

MAMMAL RECONSTRUCTION

All the species listed in Table 1 that are now extinct on Dirk Hartog Island occur elsewhere and could be reintroduced. Table 2 shows the 12 species that could be reintroduced and the potential source(s) for founder stock.

It is proposed that the Woylie could be translocated from sites in the south-west of WA and / or Karakamia providing the reasons for the current declines of this species have been identified and

addressed. The Greater Stick-nest Rat could also be translocated from the wild at Faure and/or Salutation Islands, with additional stock from the East and West Franklin Islands if necessary to boost genetic diversity.

In order to minimise pressure on isolated remnant wild populations, the Boodie, hare-wallabies and Western Barred Bandicoot could be sourced primarily from captive colonies at Dryandra and Peron, with supplementation from the wild (Bernier and Dorre Islands, Faure Island), if populations are healthy enough to accommodate the removal of small numbers of individuals.

The Chuditch, Mulgara, Dibbler, Desert Mouse, Heath Mouse and Shark Bay Mouse would require captive breeding, most probably at Perth Zoo. The Desert Mouse and Heath Mouse have not been bred in captivity previously.

This project offers the opportunity to examine the genetic consequences of mixing island populations with low genetic diversity, and mainland populations with higher levels of genetic diversity to try to maximise gene diversity and improve population viability in some species. This issue will be further discussed when translocation plans are prepared.

INTRODUCED FAUNA ERADICATION

The eradication of introduced sheep, goats and feral cats (and black rats, if present) will be crucial to the success of this program and mammal translocations will not proceed unless the eradications are successful. The removal of sheep will be the responsibility of the current pastoral lease holder and is expected to be completed by April 2007. Goat eradication will be undertaken by CALM and is expected to be close to completion by May 2007. Feral cat eradication will be undertaken by CALM and is expected to be completed by July 2008 (Algar and Brazell 2006). Control / eradication of the introduced house mouse is not proposed at this stage. However information on their distribution and abundance on the island will be collected over the next five years and consideration given to an eradication program if considered necessary. Mammal translocations will not commence until a cat / goat / sheep free environment has been confirmed for three years. On the smaller Faure Island (5800ha), nine months was considered adequate time to confirm the success of a cat eradication program in 2000, but on the Montebello islands two years was not adequate time to confirm the success of a black rat eradication program. This proposal is based on the assumption that sheep, goats and cats will have been successfully eradicated from Dirk Hartog Island by July 2008 and that mammal translocations will commence three years later, in July 2011.

TRANSLOCATION PROGRAM

It is proposed that the 12 species listed in Table 2 be reintroduced to Dirk Hartog Island over a 10 year period, with two species being reintroduced in most years. The timing of reintroductions is shown in Table 3. The first translocations would occur in July 2011, however this would be preceded by 2.5 - 3 years of staff appointments, reconnoitre and site selection, infrastructure establishment, and the collection of founders and monitoring of founder populations for the first species to be translocation. This activity would commence in July - October 2008.

Table 3 includes the Rufous Hare-wallaby and Banded Hare-wallaby as species for translocation, despite there being no record at present of their occurrence on Dirk Hartog Island. Their inclusion will be reconsidered after the sub-fossil survey proposed by Alex Baynes in July – October 2006. Even if no sign of the Banded Hare-wallaby is found during this survey, it may still be considered for translocation to Dirk Hartog Island for conservation reasons. Any additional species recorded during the sub-fossil survey will also be included in the translocation program.

A generic set of guidelines would be used where possible for the translocation of each species, however these may be modified depending on the species' ecology, life history and ability of the source population to support removal of animals over two consecutive years. They would include:

- Translocations for each species to occur over two years (assuming translocation in first year is successful) i.e. initial release in year 1 followed by restocking in year 2.
- Translocations to occur in winter / spring.
- At least 40 founders per year are translocated, at the same time.
- At least 20 of these to be intensively monitored via radiotracking.
- Monitoring would include an initial six week period immediately after release, followed by two week monitoring periods of radio-tagged animals every 6-8 weeks for at least the next 2-3 years after each release.
- Additional monitoring of non-radio-tagged animals would occur at least every 6 months after this time and be restricted to cooler months between March/April and September/October each year.
- All releases will be “hard” releases. i.e no temporary holding pens.
- Source populations will be monitored.

STAFFING

It is envisaged that this project would be undertaken jointly by staff from within the Fauna Conservation Program, Science Division, and Regional Services staff from the Shark Bay District, Mid-west Region. The equivalent of five FTEs is considered to be necessary for this project to be implemented effectively. Three new positions (1 Science, 2 Regional Services) dedicated to this project would be required. The other 2 FTE requirements would be made up from existing staff in the Science Fauna Conservation Program and the Denham District Project Eden team. Perth Zoo would require an average of 2 FTEs for the period they would be involved in captive breeding (2012/13 – 2018/19) and will contribute another 2 FTEs and some existing infrastructure (breeding pens etc) to the captive breeding program.

BUDGET

A summary of the budget required for new staff salaries, infrastructure establishment, site selection, equipment, captive breeding, translocation and monitoring, and the monitoring of source populations is shown in Table 4, with more details shown at Appendix 1. Costings are based on 2006 dollars. A total of \$8.72 million will be required from July 2008 to June 2022 to undertake this program. After the translocations have been completed in 2022, an ongoing budget of approximately \$123,000 per year will be required to allow routine, less frequent monitoring of the Dirk Hartog Island fauna.

Species	Last record
Boodie <i>Bettongia lesueur</i>	Extinct - Skull collected by Quoy and Gaimard in 1824, also the Herald expedition in 1858, and sub fossil.
Woylie <i>Bettongia penicillata</i>	Extinct - Sub fossil deposits
Banded Hare-wallaby <i>Lagostrophus fasciatus</i>	Extinct ? - Translocated in 1977. Needs additional sub fossil survey to confirm presence.
Western Barred Bandicoot <i>Perameles bougainville</i>	Extinct - Some reference to a "small opossum" by King's expedition in 1821, Denham took a bandicoot on board the HMS Herald from DHI in 1858, also sub fossil records.
Chuditch <i>Dasyurus geoffroii</i>	Extinct - Sub fossil deposits
Mulgara <i>Dasycercus cristicauda</i>	Extinct - Sub fossil deposits
Dibbler <i>Parantechinus apicalis</i>	Extinct - Sub fossil deposits
Little long-tailed dunnart <i>Sminthopsis dolichura</i>	Extant - Prince 1977 (<i>pers comm.</i>)
Ash-grey Mouse <i>Pseudomys albocinereus</i>	Extant - Burbidge and George 1978
Sandy Inland Mouse <i>Pseudomys hermannsburgensis</i>	Extant - Burbidge and George 1978
Greater Stick-nest Rat <i>Leporillus conditor</i>	Extinct - Sub fossil deposits
Desert Mouse <i>Pseudomys desertor</i>	Extinct - Sub fossil deposits
Shark Bay Mouse <i>Pseudomys fieldi</i>	Extinct - Sub fossil deposits
Heath Mouse <i>Pseudomys shortridgei</i>	Extinct - Sub fossil deposits

Table 1. Mammals reported from Dirk Hartog Island.

Species for reintroduction	Potential source(s) for founders
Boodie <i>Bettongia lesueur</i>	Wild to wild translocation from Bernier and Dorre Islands and / or Faure Island, supplemented by captive breeding at Return to Dryandra (RTD)
Woylie <i>Bettongia penicillata</i>	Wild to wild translocation from south-west sites, would depend on extent of recovery (if any) from current decline
Banded Hare-wallaby <i>Lagostrophus fasciatus</i>	Wild to wild translocation from Faure Island and/or Bernier and Dorre Islands, supplemented by captive breeding at Peron Captive Breeding Centre (PCBC).
Rufous Hare-wallaby <i>Lagorchestes hirutus</i>	Wild to wild translocation from Bernier and Dorre Islands, supplemented by captive breeding at PCBC and / or RTD. (issue of mixing mainland and island sub species?)
Western Barred Bandicoot <i>Perameles bougainville</i>	Wild to wild translocation from Bernier and Dorre Islands, supplemented by captive breeding at PCBC and / or RTD. (once disease issues resolved).
Chuditch <i>Dasyurus geoffroii</i>	Wild to captivity at Perth Zoo to build founder numbers, then release onto DHI
Mulgara <i>Dasyurus cristicauda</i>	Wild to captivity at Perth Zoo to build founder numbers, then release onto DHI
Dibbler <i>Parantechinus apicalis</i>	Wild to captivity at Perth Zoo to build founder numbers, then release onto DHI
Greater Stick-nest Rat <i>Leporillus conditor</i>	Wild to wild from Salutation and / or Faure Islands.
Desert Mouse <i>Pseudomys desertor</i>	Wild to captivity at Perth Zoo to build founder numbers, then release onto DHI
Shark Bay Mouse <i>Pseudomys fieldi</i>	Wild to captivity at Perth Zoo to build founder numbers, then release onto DHI
Heath Mouse <i>Pseudomys shortridgei</i>	Wild to captivity at Perth Zoo to build founder numbers, then release onto DHI
