

Family Baetidae

Habitat Profile for *Cloeon tasmaniae* Tillyard

Cloeon tasmaniae Tillyard was only recorded from 3 samples in Tasmania. This species is endemic and the nymph was described by Suter (2000). This species occurs in near still water from combined habitat samples at altitudes between 10-160m above sea level, 12-87km from the stream source and the substrate was mainly pebbles on gravel. The streams were between 6 -22m wide and the conductivity was between 90-724 $\mu\text{S}/\text{cm}$. No additional data were available.
