

Dugong Data: Shark Bay

Prepared by Timothy Grubba

INTRODUCTION

The primary aim of this report is to consolidate the data from a number of surveys (Table. 1) into a format that will form the basis for the development of a user-friendly database. This report focuses primarily on the data provided by two charter boat operators in Shark Bay, which logged their dugong interactions and recorded habitat data. The report also summarizes some of the previous aerial surveys carried out in Shark Bay. The available data has been entered into a spreadsheet (Excel) and the coordinates of observations were plotted on a map of Shark Bay using a geographical information system (GIS) software package ARCVIEW. A secondary aim was to identify the distribution of dugongs in the southeastern region of Dirk Hartog Island. This information will be used to make comments on a proposed aquaculture development in this area.

DATA DESCRIPTION

The data presented and discussed in this report has been obtained from two sources: 1) charter boat logs and 2) aerial surveys. Table 1 lists the data sources referred to in this report. Two charter boat operators provided logs, compiled during dugong interaction activities. The logs provide data on dugong numbers, distribution, behavior and habitat characteristics. The logs provided by James Scheerer Research Charter cover three years providing a great deal of information. The logs provided by the operator of Hartog Explorer covered two years and used a standard "CALM Dugong Watching Log". The raw data from aerial surveys was not accessible during the writing of this report. Instead reference is made to data summarized in scientific papers (Table 1.).

The logs provided by James Scheerer Research Charter formed the bulk of data that was used in this report. This extensive data set covers a three-year period from 05/07/1995 to 14/07/1998. During this period a total of 381 separate observations were made, of which 375 were Dugong observations and 6 observations on other species (megafauna: including whale sharks, whales and dolphins). The collection of data was seasonally dependent, with the majority of observations made during winter and the beginning of spring. This corresponds to the “peak season” when weather conditions are ideal and charter work is at a peak. During summer and autumn fewer observations were made due to adverse weather conditions and less charter work. A yearly and seasonal breakdown of the numbers of observations and days is provided in table 2. The log data from the charter boat Hartog Explorer is also broken down seasonally. This is a smaller data set that covers only two years. It follows the same seasonal trends as the other charter operator’s data.

Table 2. Charter Boat Observations.

James Scheerer Research Charter				
	1995	1996	1997	1998
Winter	44 obs (33 days)	19 obs (13days)	93 obs (33 days)	47 obs (19 days)
Spring	20 obs (15 days)	18 obs (12 days)	67 obs (30 days)	
Summer	-	-	19 obs (12 days)	7 obs (6 days)
Autumn	-	11 obs (10 days)	-	16 obs (12 days)

Hartog Explorer				
Winter	-	-	10 obs (10 days)	7 obs (7 days)
Spring	-	-	3 obs (3 days)	-
Summer	-	-	-	-
Autumn	-	-	-	7 obs (7 days)

When a charter operator makes contact with a dugong or group of dugongs the following information was recorded in their logs:

- Date
- Time
- Location (latitude and longitude)
- Habitat data including: water temperature, water depth, benthic habitat
- Dugong information including: numbers of adults/groups with and without calves and their behaviors.

The data collected by the two charter operators differed in regards to information recorded on dugongs and collection of habitat data. James Scheerer Research Charter recorded numbers of dugongs with calves and without calves using the following format:

groups with calves	1 cow and calf	2-5 cows and calves	≥ 6 cows and calves
groups without calves	1 cow and calf	2-5 cows and calves	≥ 6 cows and calves

Hartog Explorer recorded numbers of adults with calves and without calves using the following format:

adults with calves	1-5	>5
adults without calves	1-5	>5

The “CALM Dugong Watching Log” used by the operators of Hartog Explorer did not require the recording of habitat characteristics such as water depth, temperature and benthic habitat.

METHODS

The data logs from the two charter operations were entered into a spreadsheet (excel). The data from the two charter operators could not be combined due to incompatibility of the collected data. The James Scheerer Research Charter recorded number of groups of dugongs while the Hartog Explorer recorded numbers of adult dugongs with or without calves. In Excel the coordinates (longitude and latitude) of each observation were converted to decimal degrees, a standard unit used in GIS. The Excel file was then saved in DBF format, which was imported into ARCVIEW a GIS software package. The coordinates recorded by James Scheerer Research Charter were then plotted on a line map of Shark Bay in ARCVIEW. Various plots were produced including a total plot including all years, individual years, and seasonally combinations.

RESULTS

A hard copy of the Excel spreadsheets is provided in Appendix 1.

The coordinates from the observations of James Scheerer Research charter were plotted on a map of Shark Bay using ARCVIEW. Combinations of plots based on yearly and seasonal temporal scale were produced and are listed in table 3. Figure 1. plots all observations made between 1995 and 1998. The majority of observations were located in the area to the north of Bellefin Prong. This area includes both Bellefin flats and Heirsson flats. To the north of the flats are the Denham Channel and the Bar flats. This area is located to the west of Denham. Figures 2 to 5 plot the observations from 1995 to 1998. Figures 6 to 17 plot the observations seasonally. Figures 18 to 23 are enlarged views of the seasonal data plotted in figures 1,13,14,16, and 17. Figure 23 plots the data of James Scheerer Research Charter and dugong numbers that were extracted from aerial surveys. The positions of the aerial surveys are not accurate, as coordinates were not available for this data.

Table. List of Figures.

Dugong Observations: Autumn 1998	21
Dugong Observations: Winter 1998	22
Dugong Observations: (Numbers)	23

CONCLUSION

The data extracted from the charter boat logs provides a comprehensive database on Dugongs. When drawing conclusion from this data it is important to remember that the data displays temporal and spatial biases. The spatial bias is related to the generally limited operational areas of the charter boats. Based on this data the main operating area of the charter boats seems to be centered in the region north of Bellefin Prong. The data implies that dugong distribution is highest in this area, however the data does not show the distribution of dugongs thus misrepresenting the overall distribution of dugongs. The temporal bias is related to the seasonal operation of the charter boats. The summer and autumn seasons are not represented to the same extent as the winter season. Therefore the data doesn't represent the summer distribution of dugongs. Despite these biases the data provides important information on the local distribution of dugongs during the winter months. The data also presents information on dugong behavior and habitat.

Dugongs are distributed throughout the southeastern waters of Dirk Hartog Island during winter. It is apparent that both aerial surveys and charter boat logs misrepresent the true distribution and density of dugongs in this region. This is due to the low use of the region by charter boat operators and the infrequent number of aerial surveys. Figure 23. does show that there are congregations of dugongs in the region , and it is not uncommon for congregations of 20+ animals. There appears that significant concentrations of dugongs occur at Surf Point, Broken Down Head and off Dirk Hartog Homestead.
