Preface

Upon reading in Tony Watson's paper¹ on the distribution of Australia's dragonflies that Victoria (my home state) had only 63 species, I realised that it was a number I could get my mind around. Not like the beetles, moths or flies. Soon after, the chance finding of Fraser's handbook² of Australasian dragonflies in a secondhand book shop enabled me to extract a key to the Victorian species; thus was a new interest sparked.

Having seen many of the local species, observed prolonged tandem underwater oviposition and the temperature-induced colour change of *Austrolestes annulosus*, I wondered if it would be possible to map the distribution of the Victorian species. So I visited the collection of the Melbourne Museum only to find that the label data had not yet been digitised. Years later, after re-gluing many dislodged heads and legs, I completed that task for the whole collection, which was Australia wide. With that as a start the project burgeoned to become mapping the distribution of all species recorded within Australia. With the invaluable help of curators and collection managers I was able to assemble all of the digitised records from Australian museums. Hobart required a special visit to digitise its collection label data. A preliminary set of maps was published in updated identification key³ prepared by Gunther Theischinger and myself.

Since then I have continued to gather distribution data from overseas museums, additional records of Australian museums, species lists of visitors who can authenticate their identifications, from amongst the plethora of wildlife photographers those whose identifications I

can trust, and where there are big gaps, from the odonatalogical literature.

Encouraged by Vincent Kalkman to use the data to produce charts of flight times, it was obvious from the size and geographic spread of Australia, that any such charts would be latitude-, if not altitude-, dependent. The Interim Biogeographic Regionalisation for Australia (currently IBRA7) classifies Australia's landscapes into 89 large geographically distinct bioregions based on common climate, geology, landform, native vegetation and species information. It seemed an ideal vehicle to overcome this problem and so the distribution of each species was also sorted into IBRA7 categories before flight times were analysed. However, the characteristics which define biogeographic regions are probably not those which influence dragonfly distribution so a further analysis using climate zones was also made.

And so you have this book.

Overview

This book comprises three sections:

Distribution maps for 325 species of Australian Odonata derived from nearly 60,000 records

Checklists and flight times for each of the 89 Interim Biogeographical Regions of Australia (IBRA7)

Checklists and flight times for each of the 27 Köppen Climate Zones of Australia

Introduction

Sources of Data

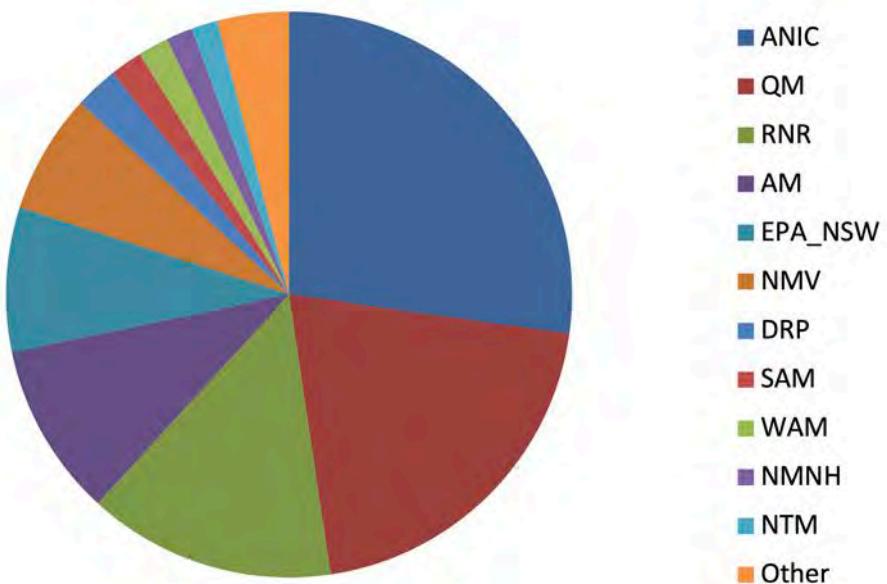

Although Australian Institutions now regularly submit their digitized label data to centralised repositories such as the Atlas of Living Australia (ALA) that resource has been used sparingly in the preparation of these distribution maps. They are based primarily on original information from the Collection Managers of the individual museums augmented, in the case of the Australian Museum, with subsequent ALA postings. Individual collectors have also been generous in sharing their specimen data and they are listed in the Acknowledgements section. As each collection has been added to the database the new information has been plotted on the maps and extreme outliers either questioned or removed. There are some which remain but they have been validated. Possibly they are due to vagrant behavior or unusual weather conditions.

Considering those Institutions or Individuals who provide more than 800 records each (and this comprises 96% of the total) we can see their relative contributions in the pie chart below.

Because Australian specimens in their collections are not digitised the substantial holdings at the London Natural History Museum and Naturalis Biodiversity Center, Leiden could not be included.

Acronyms are: ANIC (Australian National Insect Collection, Canberra); QM (Queensland Museum, Brisbane); RNR (Reiner Richter ex Atlas of Living Australia); AM (Australian Musem, Sydney); EPA_NSW (Environment Protection Authority, NSW); NMV (Museums Victoria, Melbourne); DRP (Dennis Paulson, USA); SAM (South Australian Museum, Adelaide); WAM (Western Australian Museum,

Perth); NMNH (National Museum of Natural History [Smithsonian Institution], Washington D.C.); NTM (Museum and Art Galleries of the Northern Territory, Darwin).

For those who like actual numbers:

ANIC	15,846
QM	11,923
RNR	8,266
AM	5,788
EPA_NSW	4,795
NMV	3,997
DRP	1,448
SAM	1,071
WAM	1,023
NMNH	879
NTM	871
Other	2,390
TOTAL	58,297

A project such as this is at the mercy of the idiosyncrasies of the cataloguer. If a specimen exists, its identification can be checked but if erroneous locality information has been given it can lead to large errors. One serious problem is when a specimen label says 'Australia' or even 'New Holland' or even just the State where the specimen was collected and the cataloguer assigns the geographic centroid of Australia or the State as the locality. In reality the maps show the distribution of the activity of the collectors, not insects but, it is hoped with almost 60,000 records, that the distributions are well delineated. It is possibly more of a problem when assessing flight times.

Hierarchy of reliability

The maps are colour-coded to show if the point represents a specimen, literature record, photo or observation. In decreasing order of reliability these categorizations are:

Adult Specimen

If a properly curated specimen is available its identification can be confirmed. There can be some doubt, occasionally, about locality information. Illegible writing on a label or different localities with the same name can lead to errors. Extreme outliers on the maps have been removed.

Literature

There are relatively few instances in the database and, generally, they are from the original description, therefore correct by definition.

Larval Specimen

Larvae are more difficult to identify than adults and for some no morphologically distinguishing characteristics have yet been found.

Obviously, they can't contribute to flight-time phenology

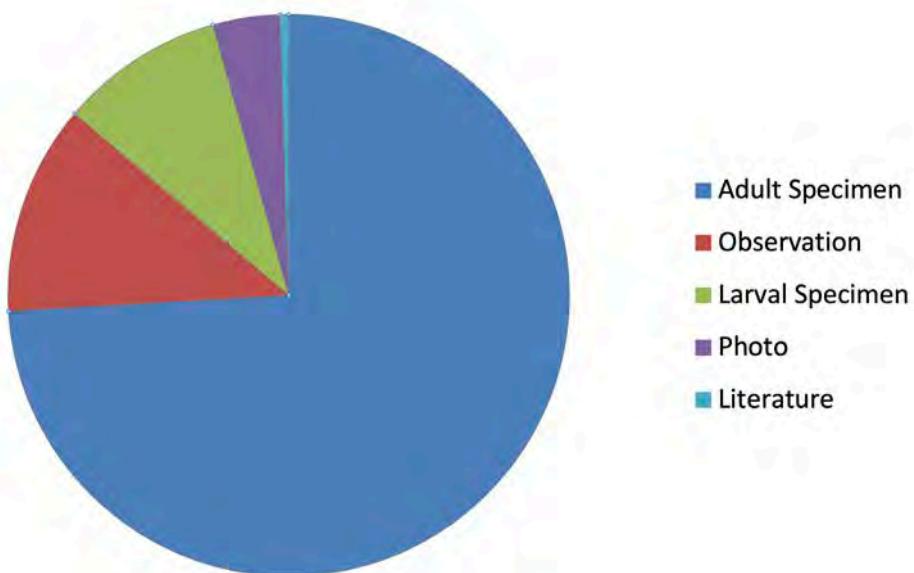

Photo

Even good photos do not always show in sufficient detail characters which are essential to separate some very similar species. Tenerals and some females are particularly problematic.

Observation

This depends on the skills and experience of the observer and, for many species, it is the most unreliable method of recording presence. With some observers it also suffers from the desire to spot rarities.

This chart shows that the bulk of the records come from adult dragonflies thus giving a high degree of confidence in the maps.

Precision of Maps and Observations

Each map square covers an area of 30' longitude x 30' latitude. On average, in Australia, this represents an area 55 km (N-S) x 45 km (E-W).

Degrees of latitude are parallel so the distance between each degree remains almost constant but since degrees of longitude are farthest apart at the equator and converge at the poles, their distance varies greatly.

Each degree of latitude is approximately 111 kilometers apart. Due to the earth's slightly ellipsoid shape the range varies from 110.567 km at the equator to 111.699 km at the poles. A degree of longitude is widest at the equator at 111.321km and gradually

lessens to zero at the poles. The length of 1 degree of Longitude = cosine (latitude in decimal degrees) * length of degree at equator. At the tip of Cape York, Australia's northernmost point [10° 41' 14.09"S, 142° 31' 52.88 E] one degree of longitude is 109 km while at the southernmost tip of Tasmania [43° 39' 14.73"S, 146° 51' 01.28 E] it is 89 km.

A change of 1 in the third decimal place of a decimal degree means only about 90 metres on the ground. Quoting six decimal points (= 0.003") (as some do) implies an accuracy of better than 10 centimetres.

What the Maps Tell Us

The database from which these maps were produced contained 58, 297 separate entries, each representing a curated specimen, a literature record, a photograph or a sighting with a high probability of being correctly identified. Dbase, the program used to generate the maps only marks one square for each collection event (i.e. species, locality, date) and it has 35,900 entries. So, 38% of records came from multiple captures from the same locality on the same date.

Four of those specimens are *Agriocnemis exsudans* from the Australian Territory of Norfolk Island and are not included on the maps of the mainland. Twelve specimens have no coordinates but do have a locality given which might enable them to be mapped if addressed by someone with local knowledge.

There are maps for 325 species. Half the species account for 94% of the database occurrences. It is a very skewed distribution. Invoking Pareto's Rule we see that 80% of the specimens are from 87 species, 27% of the total number.

Fifty-three species have less than 10 occurrences in the database while five have only one:

Austrogomphus pusillus Sjöstedt, 1917; *Eusynthemis cooloola* Theischinger, 2018; *Hemigomphus atratus* Watson, 1991; *Micromidia rodericki* Fraser, 1959; *Telephlebia undia* Theischinger, 1985.

Eusynthemis cooloola has been recently described from a single adult male specimen collected in 1984.

The top 10, each with more than 1,000 specimens, photos or sightings are:

Ischnura heterosticta

Diplacodes bipunctata

Austroargiolestes icteromelas
Orthetrum caledonicum
Hemicordulia tau
Ischnura aurora
Diplacodes haematodes
Hemianax papuensis
Xanthagrion erythroneurum
Austrolestes leda

How many entries make good map? If we assume that number to be 30 (cf. maps for *Episynlestes cristatus* or *Petalura ingentissima*) then only 221 qualify; 32% are inadequate. If 20 points are considered enough (cf maps for *Austrogomphus arbustorum* or *Zyxomma petiolatum*) then another 18 would be added but the number of inadequate ones is still slightly more than a quarter. The geographic spread of the points has quite a bearing on these appearances.

Flight Seasons

An important aspect of the phenology of Dragonflies is the studying the flight times of Adults. Date of capture might be a possible surrogate to analyse flight seasons. However there are some difficulties:

1. Australia has a large latitudinal and climate range;
2. Actually we are sampling the visits of collectors rather than dragonflies;
3. Some collectors take a large series of specimens; others don't. This could bias the sampling and analysis.

Ideally, the sampling effort should have been consistent across all months within a specified zone, using the same protocol.

Zonation

Some dragonflies have a large latitudinal range within Australia. Comparing the flight times of *Hemianax papuensis* from Cape York with those from central Tasmania bears no sense. Similarly for *Ischnura aurora*, *Ischnura heterosticta* and any other species with a large geographic range. One solution to this might be to consider partitioning the lists into discrete regions. Based on global ecoregions the Interim Biogeographic Regionalisation for

Australia (IBRA), was prepared giving distinct bioregions based on common climate, geology, landform, native vegetation and species information. IBRA was developed in 1993-94 and version 6.1 was published in 2004. It comprised 85 bioregions and 403 subregions, subregions are more localised and homogenous geomorphological units in each bioregion. Descriptions of each bioregion were taken from internet listings for IBRA6.1. In 2014 IBRA 7 defined 89 bioregions and 419 subregions, adding four new oceanic bioregions: the Indian Tropical Islands Bioregion, the Pacific Subtropical Islands Bioregion, the Subantarctic Islands Bioregion and the Coral Sea Bioregion. These bioregions account for Australia's island territories including Christmas Island in the Indian Ocean, Macquarie Island in the Southern Ocean, Norfolk and Lord Howe Islands in the Pacific Ocean and the Coral Sea Islands Territory. Flight time charts, which also serve as local checklists, for the IBRA 7 zones can be found between pages 69 and 241. Almost 10% of records are from larvae but collection dates of specimens of larvae cannot contribute to flight calendars for adults so they have been ignored. However, on the rare occasion where a larva species has been sampled without a comparable adult being recorded, that larva is included in the total number of species.

The totals in the flight charts are raw numbers of specimens or observations. No attempt has been made to standardize (or colour-code) them for comparison. In this way they give an appreciation of the total numbers that have been included.

In hindsight a zonation based on geomorphological and vegetation characteristics, such as the IBRA parameters is not consistent with dragonfly biology. Hydrology and temperature are likely to be more relevant so perhaps climate zones should be used. The **Köppen climate classification** is one of the most widely used climate classification systems. It was first published by the German-Russian climatologist Wladimir Köppen from the University of Graz, Austria in 1884. It is based on the assumption that native vegetation is the best indicator of climate zone boundaries. The classification divides climates into five main climate groups, with each group, and its subgroups, being based on seasonal precipitation and temperature patterns. His five main groups are A (tropical), B (dry), C (temperate), D (continental), and E (polar). Stern *et al* (2000)⁴ modified the scheme for Australian conditions, using mean monthly rainfall, mean annual rainfall, mean maximum temperature and mean minimum temperature from the Bureau of Meteorology's records for the 30-year period 1961-1990. The resulting 27 zones, with the number of records and number of species of dragonflies, are:

4. Stern H., de Hoedt, G. & Ernst, J. (2000). Objective classification of Australian climates. *Australian Meteorological Magazine* 49: 87-96

	Species	Specimens
Desert - Hot (persistently dry)	28	448
Desert - Hot (Summer drought)	12	89
Desert - Hot (Winter drought)	16	67
Desert - Warm (persistently dry)	9	21
Equatorial - Rainforest (monsoonal)	12	27
Equatorial - Savanna	105	2423
Grassland - Hot (persistently dry)	52	1463
Grassland - Hot (Summer drought)	41	578
Grassland - Hot (Winter drought)	91	1421
Grassland - Warm (persistently dry)	38	1204
Grassland - Warm (Summer drought)	5	10
Subtropical - Distinctly dry summer	35	1086
Subtropical - Distinctly dry winter	106	1111
Subtropical - Moderately dry winter	108	1616
Subtropical - No dry season	190	10251
Temperate - Distinctly dry (and hot) Summer	40	925
Temperate - Distinctly dry (and mild) Summer	1	1
Temperate - Distinctly dry (and warm) Summer	54	1387
Temperate - Moderately dry Winter (hot Summer)	43	202
Temperate - Moderately dry Winter (warm Summer)	11	15
Temperate - No dry season (cool Summer)	23	206
Temperate - No dry season (hot Summer)	123	4482
Temperate - No dry season (mild Summer)	95	4788
Temperate - No dry season (warm Summer)	126	16214
Tropical - Rainforest (monsoonal)	127	2341
Tropical - Rainforest (persistently wet)	103	1071
Tropical - Savanna	155	4828

Flight time charts, which also serve as local checklists, for the Australian Köppen climate zones can be found between pages 242 and 318. The same caveats which relate to the use of larvae in IBRA7 zones also apply here.

It could be constructive to see whether there are any common factors in the most populous climate zones that determine dragonfly preference. Eighty percent of the specimens come from just eight climate zones.

These are, in descending order:

- Temperate - No dry season (warm Summer)
- Subtropical - No dry season
- Tropical - Savanna
- Temperate - No dry season (mild Summer)
- Temperate - No dry season (hot Summer)
- Equatorial - Savanna
- Tropical - Rainforest (monsoonal)
- Subtropical - Moderately dry winter

There seems to be no common factor standing out from these groups except No Dry Season which is understandable.

Inequitable Sampling

The problem of inequitable sampling is best demonstrated by reference to IBRA7 zone DEU – Desert Uplands – an area in central Queensland.

While there are records of 140 specimens and 32 species they were made over only effectively five visits most of which were in April.

16-April-1973
30-April-1980
08-April, 09-April, 11-April, 12-April,
13-April, 14-April, 15-April, 16-April,
17-April, 18-April-2000
16-December-2006
28-October-2010

Checklists

The checklists which are the basis for the individual flight time charts are based on:

The classification and diversity of dragonflies and damselflies (Odonata) (2013) Dijkstra, K.-D. B., Bechly, G., Bybee, S.M., Dow, R.A., Dumont, H.J., Fleck, G., Garrison, R.W., Hääläinen, M., Kalkman, V.J., Karube, H., May, M.L., Orr, A.G., Paulson, D.R., Rehn,

A.C., Theischinger, G., Trueman, J.W.H., van Tol, J., von Ellenreider, N. & Ware, J. pp. 36-45 in: Zhang, Z-Q. (Ed.) *Animal Diversity: An Outline of Higher Classification and Survey of Taxonomic Richness (Addenda)*. *Zootaxa* 3703: 1-82.

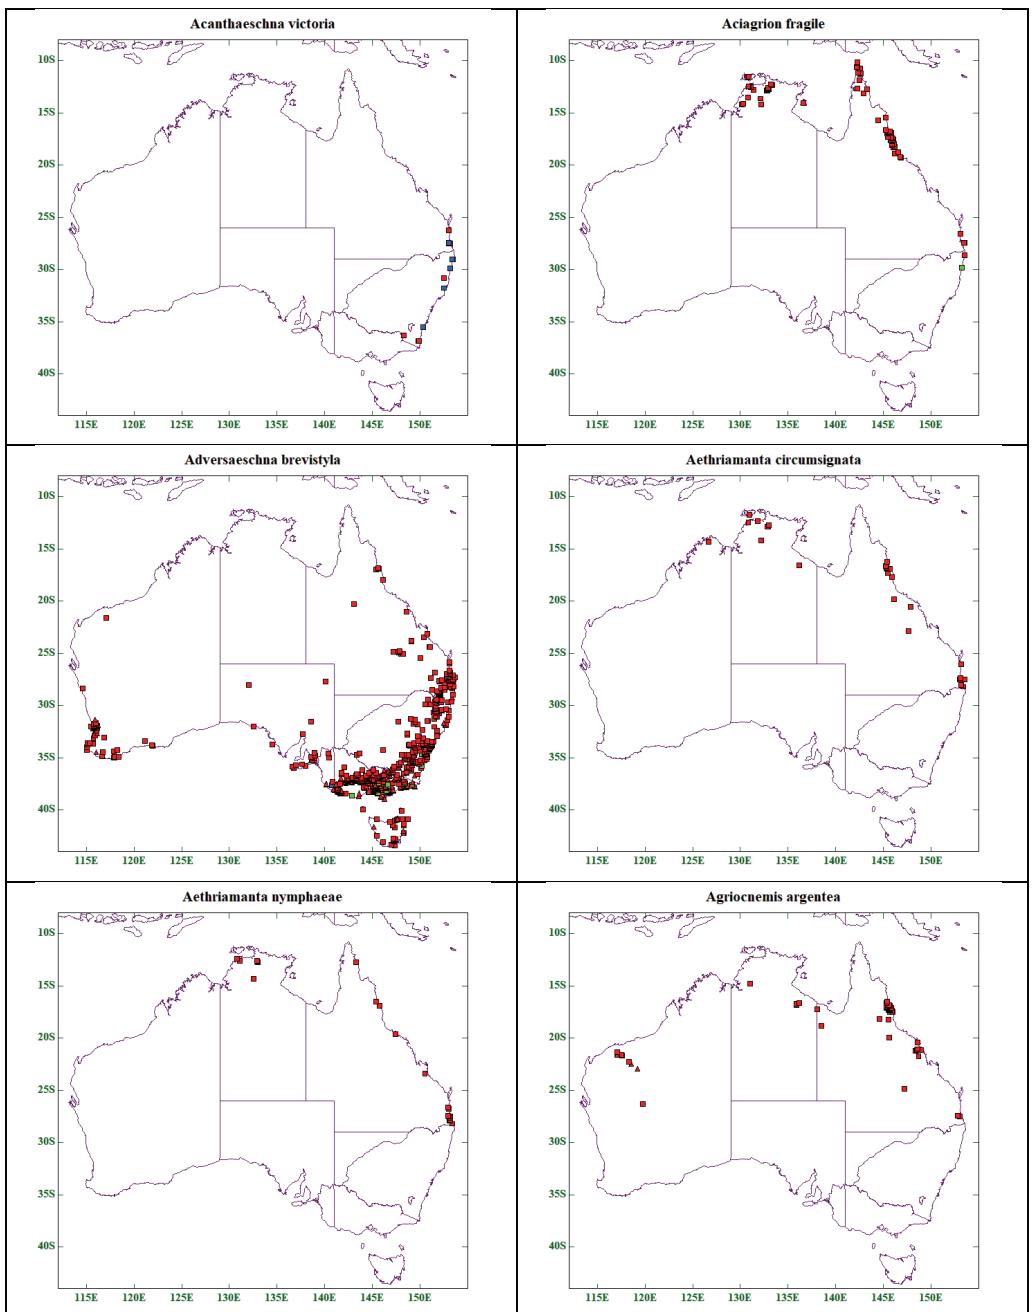

Generic revision of Argiolestidae (Odonata), with four new genera. (2013) Kalkman, V.J. & Theischinger, G. *International Journal of Odonatology* 16(1): 1-52

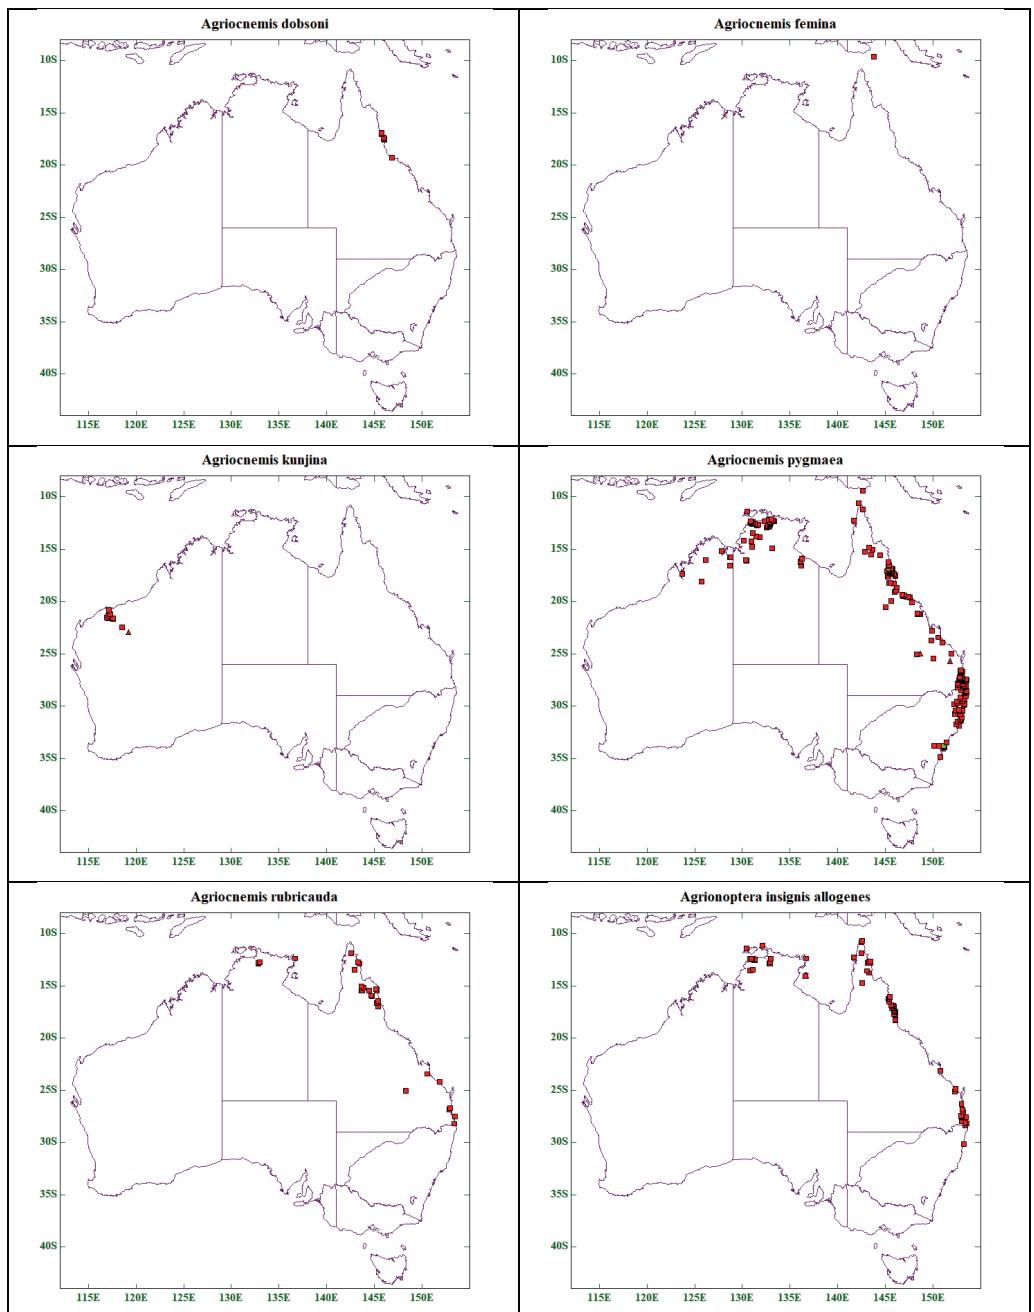

The authors of the first article consider the Australian genera *Apocordulia*, *Archaeophya*, *Austrocordulia*, *Austrophya*, *Cordulephya*, *Hesperocordulia*, *Lathrocordulia*, *Micromidia*, and *Pseudocordulia* to be *incertae sedis* within the Libelluloidea.

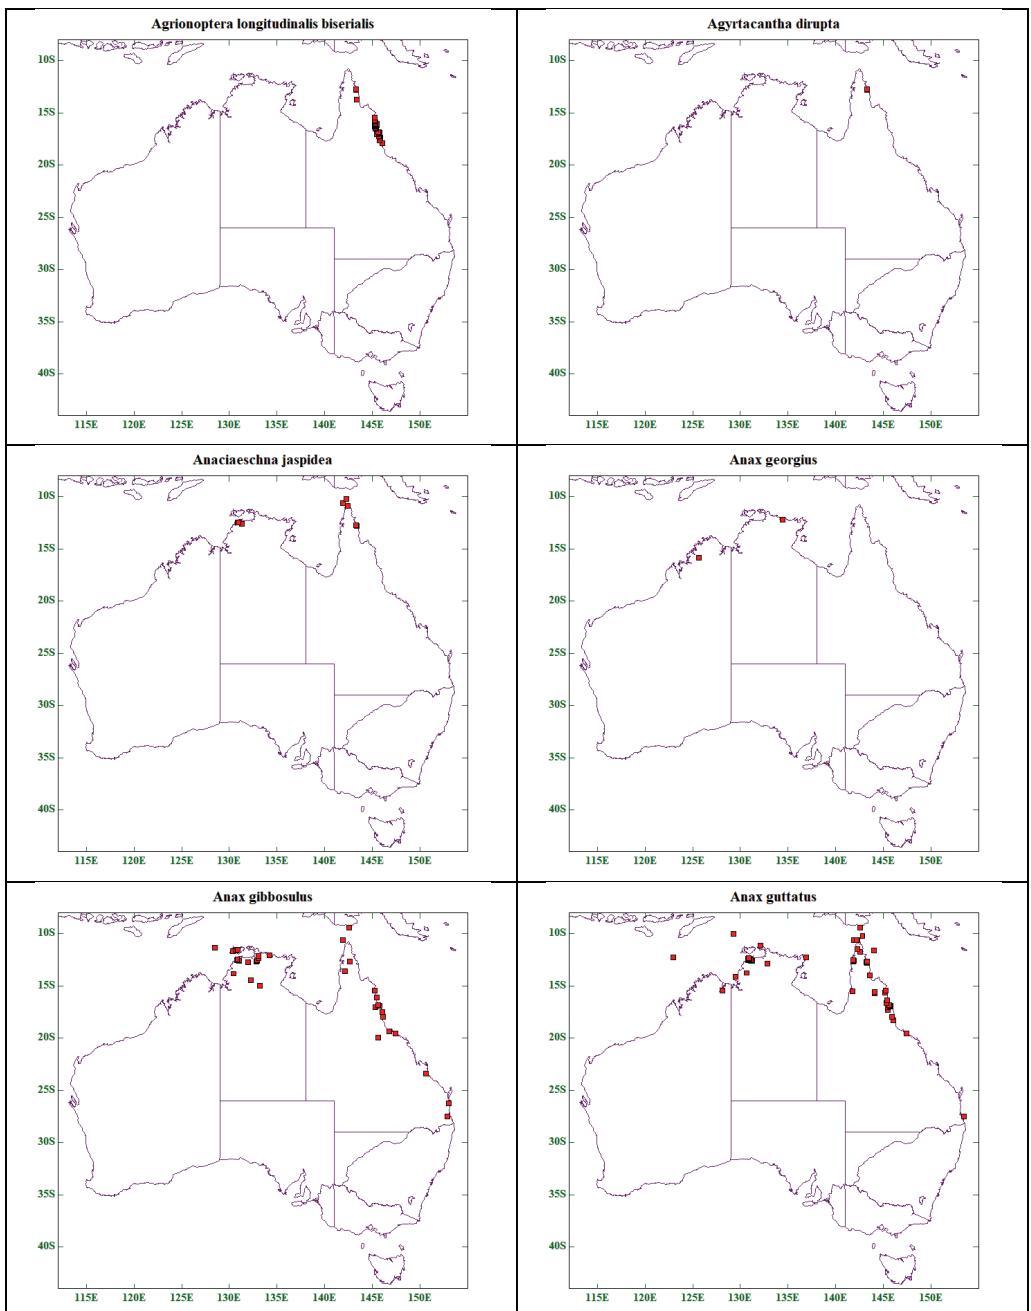

Austrocoenagrion [as opposed to *Coenagrion lyelli*] was resurrected in Dijkstra, K.-D.B., & Kalkman, V.J. 2012. Phylogeny, classification and taxonomy of European dragonflies and damselflies (Odonata): a review. *Organisms Diversity and Evolution* 12: 209-227, and repeated in Dijkstra, K.-D.B., Kalkman, V.J., Dow, R.A., Stokvis, F.R. & van Tol, J. 2013. Redefining the damselfly families: a comprehensive molecular phylogeny of Zygoptera (Odonata). *Systematic Entomology* 39: 68-96.

TNS	Tasmanian Northern Slopes

Collection dates of specimens of larvae cannot contribute to flight calendars for adults so they have been ignored. However, on the rare occasion where a larva species has been sampled without a comparable adult being recorded, that larva is included in the total number of species.

Not all museum labels record the date of capture. The number of specimens without a date has been included in the final column headed "n.d.". This allows the full number of records on file to be seen so as to give some idea of which are the predominant species in the zone.

The order of the IBRA7 zones is not alphabetical but approximately contiguous starting at Cape York Peninsula. An index is given on page 69.

CYP Cape York Peninsula 12,256,457 ha

Complex geology dominated by the Torres Strait Volcanics in the north, the metamorphic rocks and acid intrusive rocks of various ages of the Coen-Yambo Inlier which runs north-south along the eastern margin of the region and encompasses the high-altitude/high-rainfall areas of Iron Range and McIlwraith Range. The deeply dissected sandstone plateaus and ranges of the Battle Camp Sandstones lie in the south of the region adjacent to the undulating

Laura Lowlands composed of residual weathered sands and flat plains of colluvial and alluvial clays, silts and sands. The west of the region is dominated in the south by the extensive Tertiary sand sheet dissected by intricate drainage systems of the Holroyd Plain, the Tertiary laterite of the undulating Weipa Plateau, the low rises of Mesozoic sandstones, with the northern extension of the Weipa Plateau and extensive coastal plains adjoining the Gulf of Carpentaria. Extensive aeolian dune fields lie in the east associated with Cape Bedford/Cape Flattery in the south and the Olive and Jardine Rivers.

The vegetation is predominantly *Eucalyptus tetrodonta* and *Corymbia tessellaris/C. clarkeana* woodlands, *Melaleuca viridiflora* woodlands, heathlands and sedgelands, notophyll vine forests, with semi-deciduous mesophyll vine forests on the eastern ranges and deciduous vine thickets on drier western slopes. Extensive mangrove forests are found in Kennedy Inlet in the north east of the region and estuaries on both the west and east coasts. Tropical humid/maritime climate, with rainfall varying from 1000 mm to 1600 mm .

Species 117 Specimens 2631 Adults 2631 Larvae 0

WET**Wet Tropics**

1,989,107 ha

The bioregion is dominated by rugged rainforested mountains, including the highest in Queensland Mt Bartle Frere (1622m). It also includes extensive plateau areas along its western margin, as well as low lying coastal plains. The most extensive lowlands are in the south, associated with the floodplains of the Tully and Herbert Rivers. Most of the bioregion drains to the Coral Sea from small coastal catchments, but higher western areas drain in the south into the Burdekin River, and in the north into tributaries of the Mitchell River. The region contains extensive areas of tropical rainforest, plus beach scrub, tall open forest, open forest, mangrove and Melaleuca woodland communities.

MII Mount Isa Inlier

6,778,263 ha

Rugged hills and outwash, primarily associated with Proterozoic rocks; skeletal soils; low open eucalypt woodlands dominated by *Eucalyptus leucophloia* and *E.pruinosa*, with a *Triodia pungens* understorey.
Semi-Arid.

Species 19 Specimens 67 Adults 67 Larvae 0

BBN**Brigalow Belt North**

13,674,533 ha

Permian volcanics and Permian-Triassic sediments of the Bowen and Galilee Basins, Carboniferous and Devonian sediments and volcanics of the Drummond Basin and coastal blocks, Cambrian and Ordovician rocks of the Anakie inlier and associated Tertiary deposits. Subhumid to semiarid. Woodlands of ironbarks (*Eucalyptus melanophloia*, *E. crebra*), poplar box and Brown's box (*E. populnea*, *E. brownii*) and brigalow (*Acacia harpophylla*), blackwood (*A. argyrodendron*) and gidgee (*A. cambagei*). Region reaches the coast in the dry coastal corridor of Proserpine - Townsville.

SEQ South Eastern Queensland 7,804,921 ha

Metamorphic and acid to basic volcanic hills and ranges (Beenleigh, D'Aguilar, Gympie, Yarraman Blocks) sediments of the Moreton, Nambour and Maryborough Basins, extensive alluvial valleys and Quaternary coastal deposits including high dunes on the sand islands such as Fraser Island. Humid. *Eucalyptus-Lophostemon-Syncarpia* tall open forests, Eucalyptus open forests and woodlands, sub-tropical rainforests often with *Araucaria cunninghamii* emergents and small areas of cool temperate rainforest dominated by *Nothofagus moorei* and semi-evergreen vine thickets, *Melaleuca quinquenervia* wetlands and Banksia low woodlands, heaths and mangrove/saltmarsh communities.

MDD Murray Darling Depression 19,958,349 ha

An extensive gently undulating sand and clay plain of Tertiary and Quaternary age frequently overlain by aeolian dunes.

Vegetation consists of semi-arid woodlands of Black Oak / Belah, Bullock Bush/ Rosewood (*Alectryon oleifolius*) and *Acacia* spp., mallee shrublands and heathlands and savanna woodlands.

The region is known in Victoria as the Victorian Mallee region and characteristically has few surface water bodies

because its soils are highly permeable and its climate promotes high evaporative losses. Approximately 70 per cent of Victoria's mallee vegetation has been cleared and as a direct consequence of farming practices, the 1930s saw a part of the Victorian Mallee become one of the worst wind eroded areas in Australia. Substantial areas of mallee remain today in the western aeolian dunes, mainly in South Australia and but also western NSW. Clearing has also been widespread in the north eastern portion of the bioregion in NSW particularly on the undulating plains and relict river channels and lakes associated with the Murray and Darling Rivers.

RIV Riverina

9,704,469 ha

An ancient riverine plain and alluvial fans composed of unconsolidated sediments with evidence of former stream channels. The Murray and Murrumbidgee Rivers and their major tributaries, the Lachlan and Goulburn Rivers flow westwards across this plain. Vegetation consists of river red gum and black box forests, box woodlands, saltbush shrublands, extensive grasslands and swamp communities.

NSS NSW South Western Slopes 8,681,126 ha

An extensive area of foothills and isolated ranges comprising the lower inland slopes of the Great Dividing Range extending through southern New South Wales to western Victoria. Vegetation consists of wet/damp sclerophyll forests, peppermint forests and box/ironbark woodlands. Extensively cleared for agriculture.

SEH South Eastern Highlands 8,375,961 ha

Steep dissected and rugged ranges extending across southern and eastern Victoria and southern NSW. Geology predominantly Palaeozoic rocks and Mesozoic rocks. Vegetation predominantly wet and dry sclerophyll forests, woodland, minor cool temperate rainforest and minor grassland and herbaceous communities. Large areas, particularly in the Box-Ironbark Forests, were felled for fuel and timber for the mines during the gold rushes in Victoria. Large areas have also been cleared in NSW for grazing or plantations.

SEC South East Corner 2,532,053 ha

A series of deeply dissected near coastal ranges composed of Devonian granites and Palaeozoic sediments, inland of a series of gently undulating terraces (piedmont downs) composed of Tertiary sediments and flanked by Quaternary coastal plains, dune fields and inlets. The regional climate is strongly influenced by the Tasman Sea and the close proximity of the coast to the Great Dividing Range. Vegetation consists of high elevation woodlands, wet and damp sclerophyll forests interspersed with rain-shadow woodlands in the Snowy River Valley. Lowland and coastal sclerophyll forests, woodlands, warm temperate rainforest and coastal communities occur in the lower areas.

AUA Australian Alps

1,232,981 ha

A series of high elevation plateaux capping the South Eastern Highlands (Region SEH) and the southern tablelands in NSW. The geology consists largely of granitic and basaltic rocks. Vegetation is dominated by alpine herbfields, and other treeless communities, snow gum woodlands and montane forests dominated by alpine ash. The Victorian Alps region essentially is bounded by the 1200 metre contour.

VIM**Victorian Midlands**

3,469,789 ha

An extensive area of foothills and isolated ranges comprising the lower inland slopes of the Great Dividing Range extending from North-eastern Victoria to Casterton in Western Victoria. Large areas of the region were cleared during the gold rushes of the late nineteenth and early twentieth centuries so today it is characterised by patches of woodland and forest interspersed with a rural landscape with modified pastures and some cropping.

Vegetation includes most of the Box Ironbark Woodland in Victoria, as well as substantial areas of Eucalyptus forests and woodlands with a grassy ground layer.

The flatter and more fertile areas of the Victorian Midlands have been substantially cleared for agriculture, principally sheep and beef cattle grazing. Timber harvesting remains an important land use in the Victorian Midlands. Much of the forests were extensively cut for timber to meet the demands of the gold mining industry of last century. In the less fertile parts of the Victorian Midlands, substantial areas of native vegetation remain today in good condition, for example, the Grampians National Park.

SCP South East Coastal Plain 1,749,237 ha

Undulating Tertiary and Quaternary coastal plains and hinterlands occur in several distinct segments (Warrnambool Plain, Otway Plain and Gippsland Plain) rise up to 200 metres in altitude and extend from Tyrendarra in the west to Lakes Entrance in the east and including Geelong, eastern Melbourne and the Mornington Peninsula. The area has a temperate climate with rainfall varying from about 500 to 1100 mm, typically with higher rainfall in winter. Adjacent areas of higher altitude (e.g. the Otway and Strzelecki Ranges) produce rainshadow effects in some parts of the area.

The Warrnambool Plain is dominated by nutrient deficient soils over low calcareous dune formations and the distinctive cliffted coastline. Much of the limestone has been overlain by more recent sediments, and between the limestone dunes, areas of swamplands are characterised by highly fertile peats and seasonal inundation. The area east of Warrnambool is characterised by deeper soils of volcanic origins overlying limestone, which are dissected by streams. The Otway Plain includes coastal plains, river valleys and foothills from the Bellarine Peninsula west to Princetown. A small isolated component at Werribee, on the western shore of Port Phillip Bay, is included. The Gippsland Plain includes lowland coastal and alluvial plains characterised by generally flat to gently undulating terrain. The coastline is varied and includes sandy beaches backed by dunes and cliffs, and shallow inlets with extensive mud and sand flats.

The vegetation includes lowland forests, open forests with shrubby or heathy understoreys, grasslands and grassy woodlands, heathlands, shrublands, freshwater and coastal wetlands, mangrove scrubs, saltmarshes, dune scrubs and coastal tussock grasslands. Extensively cleared for agriculture.

SVP Southern Volcanic Plain 2,440,340 ha

An extensive undulating basaltic plain in south-western Victoria, stretching from Melbourne west to Portland, south to Colac and north to Beaufort. It is characterised by vast open areas of grasslands, small patches of open woodland, stony rises denoting old lava flows, the low peaks of long extinct volcanoes dotting the landscape and numerous scattered large shallow lakes with extensive wetlands.

The grassland communities are floristically rich, usually dominated by Kangaroo Grass with a wide variety of perennial herbs. The open and fertile grassy plains were one of the first areas settled for agriculture in Victoria and native grasslands are now reduced to a few thousand hectares in extent. The major land use is agriculture, especially sheep and cattle grazing and cropping.

NCP Naracoorte Coastal Plain 2,458,215 ha

A broad coastal plain of Tertiary and Quaternary sediments with a regular series of calcareous sand ridges separated by inter-dune swales closed limestone depressions and young volcanoes at Mount Gambier. Vegetation is dominated by heathy woodlands and mallee shrublands with wet heaths in the inter-dune swales. Extensively cleared for agriculture.

KAN **Kanmantoo**

812,415 ha

Temperate, well defined uplands of Cambrian and Late Proterozoic marine sediments, and a lateritized surface becoming increasingly dissected northwards, with eucalypt open forests and woodlands and heaths on mottled yellow and ironstone gravelly duplex soils in the wetter areas, and *Eucalyptus odorata* and drooping sheoak on shallow rocky soils in drier areas. Extensively cleared for agriculture.

FLB**Flinders Lofty Block**

6,615,765 ha

Temperate to arid Proterozoic ranges, alluvial fans and plains, and some outcropping volcanics, with the semi arid to arid north supporting native cypress, black oak (belah) and mallee open woodlands, Eremophila and Acacia shrublands, and bluebush/saltbush chenopod shrublands on shallow, well-drained loams and moderately-deep, well-drained red duplex soils. The increase in rainfall to the south corresponds with an increase in low open woodlands of *Eucalyptus obliqua* and *E. baxteri* on deep lateritic soils, and *E. fasciculosa* and *E. cosmophylla* on shallower or sandy soils.

SSD Simpson Strzelecki Dunefields 27,984,283 ha

Arid dune fields and sandplains with sparse shrubland and spinifex hummock grassland, and cane grass on deep sands along dune crests. Large salt lakes, notably Lake Eyre and many clay pans are dispersed amongst the dunes. Several significant arid rivers terminate at Lake Eyre, Cooper Creek and Warburton River. They are fringed with coolibah and redgum woodlands.

EYB Eyre Yorke Block 6,120,409 ha

Archaean basement rocks and Proterozoic sandstones overlain by undulating to occasionally hilly calcarenite and calcrete plains and areas of aeolian quartz sands, with mallee woodlands, shrublands and heaths on calcareous earths, duplex soils and calcareous to shallow sands, now largely cleared for agriculture.

COO Coolgardie

12,912,209 ha

Granite strata of Yilgarn Craton with Archaean Greenstone intrusions in parallel belts. Drainage is occluded. Mallees and scrubs on sandplains associated with lateritised uplands, playas and granite outcrops. Diverse woodlands rich in endemic eucalypts, on low greenstone hills, valley alluvials and broad plains of calcareous earths. In the west, the scrubs are rich in endemic Proteaceae, in the east they are rich in endemic acacias. Arid to Semi-arid Warm Mediterranean.

AVW Avon Wheatbelt

9,517,104 ha

Area of active drainage dissecting a Tertiary plateau in Yilgarn Craton. Gently undulating landscape of low relief. Proteaceous scrub-heaths, rich in endemics, on residual lateritic uplands and derived sandplains; mixed eucalypt, *Allocasuarina huegeliana* and Jam-York Gum woodlands on Quaternary alluvials and eluvials. Semi-arid (Dry) Warm Mediterranean. The south eastern boundary has been modified incorporating a small portion into the Mallee region. Extensively cleared for agriculture.

JAF**Jarra Forest**

4,509,074 ha

Duricrusted plateau of Yilgarn Craton characterised by Jarrah-Marri forest on laterite gravels and, in the eastern part, by Marri-Wandoo woodlands on clayey soils. Eluvial and alluvial deposits support *Agonis* shrublands. In areas of Mesozoic sediments, Jarrah forests occur in a mosaic with a variety of species-rich shrublands. Warm Mediterranean climate.

WAR Warren

844,771 ha

Dissected undulating country of the Leeuwin Complex and Albany Orogen with loamy soils supporting Karri forest, laterites supporting Jarrah-Marri forest, leached sandy soils in depressions and plains supporting paperbark/sedge swamps, and Holocene marine dunes with *Agonis flexuosa* woodlands. Moderate Mediterranean.

SWA Swan Coastal Plain 1,525,798 ha

Low lying coastal plain, mainly covered with woodlands. It is dominated by Banksia or Tuart on sandy soils, *Casuarina obesa* on outwash plains, and paperbark in swampy areas. In the east, the plain rises to duricrusted Mesozoic sediments dominated by Jarrah woodland. Warm Mediterranean. Three phases of marine sand dune development provide relief. The outwash plains, once dominated by *Casuarina obesa*-marri woodlands and *Melaleuca* shrublands, are extensive only in the south.

GES Geraldton Sandplains 3,142,149 ha

Mainly proteaceous scrub-heaths, rich in endemics, on the sandy earths of an extensive, undulating, lateritic sandplain mantling Permian to Cretaceous strata. Extensive York Gum and Jam woodlands occur on outwash plains associated drainage. Semi-arid (Dry) warm Mediterranean.

YAL**Yalgoo**

5,087,577 ha

This region is an interzone between South-western Bioregions and Murchison. It is characterised by low woodlands to open woodlands of *Eucalyptus*, *Acacia* and *Callitris* on red sandy plains of the Western Yilgarn Craton and southern Carnarvon Basin. The latter has a basement of Phanerozoic sediments. This Bioregion extends westwards to the boundary of the Southwest Botanical Province, so that it includes the Toolonga Plateau of the southern Carnarvon Basin. Semi-arid to arid, warm, Mediterranean climate. Mulga, *Callitris-Eucalyptus salubris*, and Bowgada open woodlands and scrubs on earth to sandy-earth plains in the western Yilgarn Craton. Rich in ephemerals. Arid to semi-arid warm Mediterranean.

MUR**Murchison**

28,120,554 ha

Mulga low woodlands, often rich in ephemerals, on outcrop hardpan wash plains and fine-textured Quaternary alluvial and eluvial surfaces mantling granitic and greenstone strata of the northern part of the Yilgarn Craton. Surfaces associated with the occluded drainage occur throughout with hummock grasslands on Quaternary sandplains, saltbush shrublands on calcareous soils and *Halosarcia* low shrublands on saline alluvia. Areas of red sandplains with mallee-mulga parkland over hummock grasslands occur in the east.

CAR Carnarvon

8,430,172 ha

Quaternary alluvial, aeolian and marine sediments overlying Cretaceous strata. A mosaic of saline alluvial plains with samphire and saltbush low shrublands, Bowgada low woodland on sandy ridges and plains, Snakewood scrubs on clay flats, and tree to shrub steppe over hummock grasslands on and between red sand dune fields. Limestone strata with *Acacia startii* / *bivenosa* shrublands outcrop in the north, where extensive tidal flats in sheltered embayments support Mangal. Arid

PIL Pilbara

17,823,126 ha

There are four major components to the Pilbara Craton. (1) Hamersley. Mountainous area of Proterozoic sedimentary ranges and plateaux with Mulga low woodland over bunch grasses on fine textured soils and Snappy Gum over *Triodia brizoides* on skeletal sandy soils of the ranges. (2) The Fortescue Plains. Alluvial plains and river frontages. Salt marsh, mulga-bunch grass, and short grass communities on alluvial plains. River Gum woodlands fringe the drainage lines. This is the northern limit of Mulga (*Acacia aneura*). (3) Chichester. Archaean granite and basalt plains supporting shrub steppe characterised by *Acacia pyrifolia* over *Triodia pungens* hummock grasses. Snappy Gum tree steppes occur on ranges. (4) Roebourne. Quaternary alluvial plains with a grass savanna of mixed bunch and hummock grasses, and dwarf shrub steppe of *Acacia translucens* over *Triodia pungens*. Samphire, *Sporobolus* and Mangal occur on marine alluvial flats. Arid tropical with summer rain.

DAL Dampierland

8,360,871 ha

(1) Quaternary sandplain overlying Jurassic and Mesozoic sandstones with Pindan. Hummock grasslands on hills.

(2) Quaternary marine deposits on coastal plains, with Mangal, samphire - *Sporobolus* grasslands, *Melaleuca acacioides* low forests, and *Spinifex* - *Crotalaria* strand communities.

(3) Quaternary alluvial plains associated with the Permian and Mesozoic sediments of Fitzroy Trough support tree savannas of *Chrysopogon* - *Dichanthium* grasses with scattered *Eucalyptus microtheca* - *Lysiphyllo cunninghamii*. Riparian forests of River Gum and Cadjeput fringe drainages.

(4) Devonian reef limestones in the north and east support sparse tree steppe over *Triodia intermedia* and *T. wiseana* hummock grasses and vine thicket elements.

Dry hot tropical, semi-arid summer rainfall.

CEK Central Kimberley 7,675,587 ha

Hilly to mountainous country with parallel siliceous ranges of Proterozoic sedimentary rocks with skeletal sandy soils supporting *Plectrachne pungens* hummock grasses with scattered trees, and with earths on Proterozoic volcanics in valleys supporting Ribbon Grass with scattered trees. Open forests of River Gum and Pandanus occur along drainage lines. Dry hot tropical, sub-humid to semi-arid, summer rainfall.

NOK Northern Kimberley 8,420,100 ha

Dissected plateau of Kimberley Basin. Savanna woodland of Woolybutt and Darwin Stringybark over high Sorghum grasses and *Plectrachne schinzii* hummock grasses on shallow sandy soils on outcropping Proterozoic siliceous sandstone strata. Savanna woodlands on *Eucalyptus tectifica* - *E. grandiflora* alliance over high Sorghum grasses on red and yellow earths mantling basic Proterozoic volcanics. Riparian closed forests of paperbark trees and *Pandanus* occur along drainage lines. Extensive Mangal occurs in estuaries and sheltered embayments. Numerous small patches of monsoon rainforest are scattered through the district. Dry hot tropical, sub-humid, summer rainfall.

VIB Victoria Bonaparte 7,301,242 ha

Phanerozoic strata of the Bonaparte Basin in the north-western part are mantled by Quaternary marine sediments supporting Samphire - *Sporobolus* grasslands and mangal, and by red earth plains and black soil plains with an open savanna of high grasses. Outcrops of Devonian limestone karst in the west support tree steppe and vine thicket. Plateaux and abrupt ranges of Proterozoic sandstone, known as the Victoria Plateau, occur in the south and east, and are partially mantled by skeletal sandy soils with low tree savannas and hummock grasslands. In the south east are limited areas of gently undulating terrain on a variety of sedimentary rocks supporting low Snappy Gum over hummock grasslands and also of gently sloping floodplains supporting *Melaleuca minutifolia* low woodland over annual sorghums. Dry hot tropical, semi-arid summer rainfall.

OVP Ord Victoria Plain 12,540,703 ha

Level to gently undulating plains with scattered hills on Cambrian volcanics and Proterozoic sedimentary rocks; vertosols on plains and predominantly skeletal soils on hills; grassland with scattered Bloodwood and Snappy Gum with spinifex and annual grasses. Dry hot tropical, semi-arid summer rainfall. The lithological mosaic has three main components: (1) Abrupt Proterozoic and Phanerozoic ranges and scattered hills mantled by shallow sand and loam soils supporting *Triodia* hummock grasslands with sparse low trees. (2) Cambrian volcanics and limestones form extensive plains with short grass (*Enneapogon* spp.) on dry calcareous soils and medium-height grassland communities (*Astrebla* and *Dichanthium*) on cracking clays. Riparian forests of River Gums fringe drainage lines. (3) In the south-west, Phanerozoic strata expressed as often lateritised upland sandplains with sparse trees. This component recurs as the Sturt Plateau Region in central Northern Territory.

DAC Darwin Coastal

2,843,199 ha

Gently undulating plains on lateritised Cretaceous sandstones and siltstones; sandy and loamy red and yellow earths and siliceous sands from near the mouth of the Victoria River to just west of Cobourg Peninsula. The most notable vegetation feature is the extensive and diverse floodplain environment associated with the lower reaches of the many large river systems. There are also substantial areas of mangroves, and rainforest and other riparian vegetation fringing the rivers. Inland from the coast, the dominant vegetation type is eucalypt tall open forest, typically dominated by Darwin woollybutt (*Eucalyptus miniata*) and Darwin stringybark (*E. tetrodonta*). Large waterbird colonies are a major conservation value of the bioregion.

TIW**Tiwi Cobourg**

1,010,580 ha

This coastal region includes Australia's second and fifth largest islands (Melville and Bathurst Island in the Tiwi Island group), Croker Island and the adjacent Cobourg Peninsula. Coastal vegetation includes some mangroves and saline flats, although this bioregion lacks the large rivers which influence vegetation patterning in other coastal regions. Most of this bioregion is covered by tall eucalypt open forests, typically dominated by

Darwin woollybutt (*Eucalyptus miniata*), Darwin stringybark (*E. tetrodonta*) and Melville Island bloodwood (*E. nesophila*), but often with northern cypress-pine *Callitris intratropica* and the tall palm *Gronophyllum ramsayi* co-dominant. The Tiwi Islands support a relatively high density and total area of monsoon rainforest patches, with distinctive species composition. There are also substantial areas there of a distinctive "treeless plain" vegetation. This bioregion is of low relief, with laterite and Cretaceous sandstone the dominant substrates. The Tiwi Islands support about 20 endemic plant and vertebrate animal taxa. The bioregions contains some important marine turtle breeding sites, and a Ramsar wetland on the Cobourg Peninsula. The bioregion is entirely Aboriginal land.

PCK Pine Creek

2,851,777 ha

Foothill environments below and to the west of the western Arnhem Land sandstone massif. Its main defining feature is the highly mineraliferous Pine Creek Geosyncline, comprising Archaean granite and gneiss overlain by Palaeoprotozoic sediments. The major vegetation types are eucalypt tall open forests, typically dominated by Darwin woollybutt (*Eucalyptus miniata*) and Darwin stringybark (*E. tetrodonta*), and woodlands (dominated by a range of species including *E. grandifolia*, *E. latifolia*, *E. tintinnans*, *E. confertiflora* and *E. tectifica*), with smaller areas of monsoon rainforest patches, *Melaleuca* woodlands, riparian vegetation and tussock grasslands. Characteristic species include the granivorous birds Gouldian finch *Erythrura gouldii*, hooded parrot *Psephotus dissimilis* and partridge pigeon *Geophaps smithii*.

ARP**Arnhem Plateau**

2,306,023 ha

The extensive and highly dissected Proterozoic sandstone massif of western Arnhem Land, which forms the headwaters of many of the major river systems of the Top End. It supports an unusually diverse biota, including very many relictual and endemic plant and animal species. The major vegetation types include sandstone heathlands, rainforests (characteristically dominated by the endemic tree *Allosyncarpia ternata*), hummock grasslands and eucalypt open woodlands (with a range of dominants including *Eucalyptus phoenicea*, *E. kombolgiensis*, *E. miniata* and *E. dichromophloia*). Most of the bioregion is Aboriginal land, including a major part of Kakadu National Park.

ARC**Arnhem Coast**

3,335,669 ha

Coastal strip extending from just east of Cobourg Peninsula to just north of the mouth of the Rose River in southeastern Arnhem Land, and including many offshore islands, most notably Groote Eylandt (and its satellites), the English Company and Wessel group, and the Crocodile Islands. Coastal vegetation includes well developed heathlands, mangroves and saline flats, with some floodplain and wetland areas, most notably the extensive paperbark forest and sedgelands of the Arafura Swamp. Coastal dune systems are unusually well developed on sections of Groote Eylandt and Cape Arnhem Peninsula. Rugged Cretaceous sandstone areas occur on Groote Eylandt and islands of the Wessel group. Tertiary laterites are extensive on the Gove Peninsula. Inland from the coast, the dominant vegetation type is eucalypt tall open forest, typically dominated by Darwin woollybutt (*Eucalyptus miniata*) and Darwin stringybark (*E. tetrodonta*), with smaller areas of monsoon rainforest and eucalypt woodlands.

KIN King

425,567 ha

Perhumid warm coastal plains and low hills comprising King Island and the north-western tip of Tasmania. It is a region of subdued topography and low relief. Precambrian metamorphic rocks are overlain by diverse soils, including recent marine deposits covered by deep sandy profiles that support extensive *Eucalyptus obliqua* open forest and *Nothofagus cunninghamii* closed forest. *Acacia melanoxylon* closed forest and *Melaleuca ericifolia* closed forest occur on poorly drained low-lying sites. The vegetation of King Island has been substantially degraded by clearing and burning following European settlement.

FUR Furneaux

537,543 ha

Moist and dry subhumid warm coastal plains and granitic island chain comprised of the Furneaux islands and coastal north-eastern Tasmania.

Devonian granites dominate the elevated areas of the subregion forming low rugged ranges.

These are overlain by shallow stony/gravelly gradational or duplex soils carrying *Eucalyptus amygdalina* open forest and woodland with *Eucalyptus nitida* open heath on higher peaks.

Quaternary/Tertiary materials overlain by deep sandy soils

typify extensive lowland plains, coastal deposits and dunes. Coastal plains have been heavily modified by agriculture (grazing).

TCH Tasmanian Central Highlands 767,849 ha

Perhumid cool to cold high plateau surface and rugged mountain ranges to the west formed by Jurassic dolerite and Tertiary basalts, with skeletal soils to alluvium in valleys, and humid cool to cold lower plateau surface underlain by Jurassic dolerite, Permo-Triassic sediments and Tertiary basalts, with sandy to clay loam soils. Vegetation ranging from dry sclerophyll woodlands and wet sclerophyll forest on the lower plateau to alpine complexes and coniferous forest patches in fertile, fire protected situations on the higher plateau. Land use is a combination of conservation, forestry, agriculture (grazing) and water catchment.

BEL**Ben Lomond**

657,500 ha

Humid cool/cold mountain ranges situated in Tasmania's inland north-east. The mountains are capped by Jurassic dolerite with shallow gradational soils. Silurian-Devonian siltstones and mudstones covered with gradational soils constitute a substantial part of the lower hills. Lowland vegetation comprising mainly open sclerophyll woodlands and heath while the upper slopes consist of wet sclerophyll forests, some rainforest and alpine vegetation in the highest regions. Land use: forestry, mining and agriculture (grazing).

TNM Tasmanian Northern Midlands 415,445 ha

Dry subhumid cool inland lowland plain underlain by Tertiary basalts, Jurassic dolerite, Permo-Triassic sand-stones, and recent alluvium lying in the Tamar. Vegetation comprises grasslands and grassy woodlands on deep loams and alluvium and dry sclerophyll forest and woodland on Tertiary. Grasslands and woodlands have been reduced to remnants. Land use is primarily agriculture (grazing) with some forestry. Extensively cleared for agriculture.

TSE**Tasmanian South East**

1,131,822 ha

Subhumid cool to subhumid warm coastal plains on a highly indented coastline, bordered inland by low mountain ranges formed from Jurassic dolerite and Permo-Triassic sediments. Soils predominantly clay to sandy loams. Vegetation is predominantly dry sclerophyll forest, with patches of wet sclerophyll forest, relict rainforest, coastal heath and dry coniferous forest. Extensive areas have been converted to improved pasture and cropland. Land is used primarily agriculture (grazing) and forestry.

TSR Tasmanian Southern Ranges 757,228 ha

Humid cool mountainous tract of central southern Tasmania. Permo-Triassic sediments and Jurassic dolerite, mantled with sandy to clay loams. Heavily forested, grading from mixed forest, wet sclerophyll forest and patches of rainforest in the uplands to dry sclerophyll forest on the coastal lowlands. Land use primarily forestry and agriculture (grazing and cropping).

TWE Tasmanian West

1,565,077 ha

Perhumid cold lowlands, low hills and low ranges, comprising most of coastal and inland western Tasmania. Folding and subsequent erosion has resulted in rugged dissected inland ranges dominated by Precambrian and Cambrian rocks supporting oligotrophic acid peat soils or shallow organic horizons over deep mineral profiles. From 300 metres elevation a discontinuous coastal plain slopes westward to the ocean.

Vegetation is a complex mosaic of rainforest (*Nothofagus*), buttongrass (*Gymnoschoenus sphaerocephalus*) moorlands and *Eucalyptus nitida* scrub. Principal land uses are conservation, mining and forestry.

Köppen Climate Zones for Australia

Desert - Hot (persistently dry)	315
Desert - Hot (Summer drought)	246
Desert - Hot (Winter drought)	246
Desert Warm - (persistently dry)	246
Equatorial - Rainforest (monsoonal)	246
Equatorial - Savanna	283
Grassland - Hot (persistently dry)	302
Grassland - Hot (Summer drought)	307
Grassland - Hot (Winter drought)	295
Grassland - Warm (persistently dry)	311
Grassland - Warm (Summer drought)	246
Subtropical - Distinctly dry summer	313
Subtropical - Distinctly dry winter	279
Subtropical - Moderately dry winter	275
Subtropical - No dry season	248

Temperate - Distinctly dry (and hot) Summer	309
Temperate - Distinctly dry (and mild) Summer	246
Temperate - Distinctly dry (and warm) Summer	299
Temperate - Moderately dry Winter (hot Summer)	305
Temperate - Moderately dry Winter (warm Summer)	246
Temperate - No dry season (cool Summer)	317
Temperate - No dry season (mild Summer)	291
Temperate - No dry season (warm Summer)	265
Temperate - No dry season (hot Summer)	270
Tropical - Rainforest (monsoonal)	260
Tropical - Rainforest (persistently wet)	287
Tropical - Savanna	254

The seven climate zones with the fewest number of species, ranging from 16 to one, do not warrant individual checklists and flight time charts. From the maps below it can be seen that they comprise desert areas or regions that are small or are predominantly offshore. A table is given showing the species recorded for each of these zones.

For those zones with greater numbers of records, collection dates of specimens of larvae cannot contribute to flight calendars for adults so they have been ignored. However, on the rare occasion where a larva species has been sampled without a comparable adult being recorded, that larva is included in the total number of species.

Desert - hot (winter drought)

Equatorial - rainforest (monsoonal)

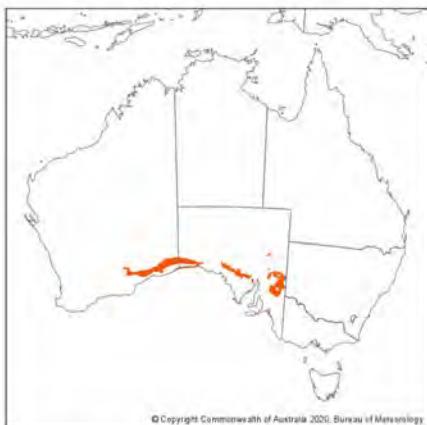

Desert - hot (summer drought)

Temperate - moderately dry winter (warm summer)

Grassland - warm (summer drought)

Desert - warm (persistently dry)

Temperate - distinctly dry (and mild) summer
