## ABSTRACT

This paper is basically an alpha code and name listing of forest and rangeland grasses, sedges, rushes, forbs, shrubs, and trees of Oregon, Washington, and Idaho. The code expedites recording of vegetation inventory data and is especially useful to those processing their data by contemporary computer systems. Editorial and secretarial personnel will find the name and authorship lists to be handy desk references.

KEYWORDS: Plant nomenclature, vegetation survey, Oregon, Washington, Idaho.

## Authors

G. A. GARRISON and J. M. SKOVLIN are Assistant Director and Project Leader, respectively, of Pacific Northwest Forest and Range Experiment Station; C. E. POULTON is Director, Range and Resource Ecology Applications of Earth Satellite Corporation; and A. H. WINWARD is Professor of Range Management at Oregon State University.

# INTRODUCTION TO FOURTH EDITION

Brief, and easily translated, alpha symbols are now the accepted "language" or code for use by vegetation scientists and those inventorying resources of forest and rangeland. These symbols greatly facilitate entering plant species identification on field sheets and assist subsequent computer compilation and analysis of vegetation data. Standardization of the symbol list among agencies and colleges within a multistate area makes it easier to adapt college students to summer fieldwork of several agencies and makes feasible the pooling of vegetation data from various institutions, agencies, and locations in a region. The code system presented here is accepted usage for many government agencies and university research workers in Oregon, Washington, and Idaho.

## Features and Additions

This fourth edition of plant coding for Oregon, Washington, and Idaho now updates the listings with hundreds of additional plant names and has been checked against the latest taxonomic works for the three-State area. The current listing maintains the basic four-letter system of symbol selection with the following standard variations:

(1) A single digit number appears as a suffix to the alpha symbol for certain species to resolve potential duplication of symbols.

(2) A fifth letter is part of most symbols which designate a genus without indicating species,

and a fifth letter also appears in those instances where a varietal name is appended to the genus and species.

(3) Some genera symbols consist of four letters or less, e.g., ACER, AIRA, GEUM, IRIS, POA, RHUS, ROSA.

In preparation for this edition an attempt was made to meet the requests of several users of the list for additional common names. Searches for these vernacular terms were not always successful; indeed, some plants have not as yet acquired an English language label and a blank follows the = sign.

A completely new feature of this listing is a notation of authorship of each scientific name, done in the form prescribed by the International Rules of Botanical Nomenclature. This tabulation should be a speedy reference source for scientists, technicians, writers, editors, and advanced students.

Partitioning of the plant symbol list by growth form is retained in this edition, i.e., separate sections for grasses, grasslike plants (sedges and rushes), forbs, shrubs, and trees. Workers needing growth-form designators for computer work will find this problem best handled by adding a numeric code on the basic data sheet such as the field plot form. A number can be added just ahead of each alpha symbol by using the following scheme:

- 1 = Grass
- 2 = Grasslike plant
- 3 = Forb (broad-leaved herbs plus ferns and allied families)
- 4 = Shrub
- 5 = Tree
- 6 = Moss

A section is again provided for locating new valid names of species whose old names have dropped into synonymy. The user of the publication is

alerted about synonyms by a numeric code on the far right side of each page of tabular material, and it instructs the reader thus:

1 = Name listed is a synonym, new name will be found in the synonymy section under the same genus; only the species name has changed.

2 = Name listed is a synonym, new valid name will be found in the synonymy section with a shift in genus shown.

Blank = Name listed is valid.

Almost all of the synonym problems involved in using this listing could be eliminated if main dependence for species identification is on the single volume "Flora of the Pacific Northwest" or the five-volume work, "Vascular Plants of the Pacific Northwest." But if the user of the code list lacks either of these works by C. Leo Hitchcock et al., the synonym list is very helpful.

Generally, scientific names in the edition were verified in the following publications:

Hitchcock, A. S.  
1950. Manual of the grasses of the United States. Ed. 2 (revised by Agnes Chase). U.S. Department of Agriculture Miscellaneous Publication 200.

Hitchcock, C. Leo, Arthur Cronquist, Marion Owenby, and J. W. Thompson.  
1955-69. Vascular plants of the Pacific Northwest. Parts 1-5. University of Washington Press, Seattle.

Hitchcock, C. Leo, and Arthur Cronquist.  
1973. Flora of the Pacific Northwest. University of Washington Press, Seattle.

Little, Elbert L., Jr.

1953. Check list of native and naturalized trees of the United States (including Alaska). U.S. Department of Agriculture Handbook No. 41.

There were some plant species in southeast and southwest portions of the province which were not covered by Hitchcock et al. In these instances, other manuals were consulted such as:

Munz, Philip A., and David D. Keck.  
1970. A flora of California. University of California Press, Berkeley.

Davis, Ray J.  
1952. Flora of Idaho. William C. Brown Co., Dubuque, Iowa.

Four subspecies were added to the woody group of sagebrush (*Artemisia* spp.) by A. H. Winward, using the sagebrush classification scheme of Beetle and Young, which was developed in their publications:

Beetle, A. A.  
1960. A study of sagebrush: The section *tridentata* of *Artemisia*. Wyoming Agricultural Experiment Station Bulletin 368.

Beetle, A. A., and A. Young.  
1965. A third subspecies in the *Artemisia tridentata* complex. *Rhodora* 67: 405-406.

## Inquiries

The lists of species shown here plus some supplementary information are stored in the files of the Oregon State University Computer Center; thus there are extracts and combinations of information from the stored material which are available as computer printouts at nominal fees. These special

listings are:

1. Scientific names in alphabetical order without respect to the growth form grouping or sequence of symbols.
2. Scientific names with listing controlled by alphabetical order of the alpha symbols.
3. Listing by common names in alphabetical order.
4. A limited listing of just those species whose alpha symbols carry a numeric suffix, the tie breaker.

Another option is change of format from this publication to one with any computer data field listed singly or in most any combination or order across the page. Requests for these compilations should be made to the Rangeland Resources Program, Oregon State University, Corvallis, Oregon 97331.

From time to time this plant symbol list will be revised to meet changes and advances in plant taxonomy. The Pacific Northwest Forest and Range Experiment Station and Oregon State University, which hold the master data and program for assigning plant symbols, will make these revisions. They will also welcome suggestions about addition of new species and the location of possible errors in the current listings.

### **History of Plant Code Development**

Genesis of plant codes for recording vegetation studies of forests and rangelands is traceable back to 1912 and involves several notable plant ecologists. This interesting history is given in the introduction to the third edition, entitled, "Northwest Range Plant Symbols." It was published in 1967 by the Pacific Northwest Forest and Range Experiment Station as Research Paper PNW-40. Supply of the third edition is exhausted, although file copies may be seen at certain libraries.
