ASSESSMENT OF WATERBIRD USAGE OF WETLAND NATURE RESERVES CONTROLLED BY THE WESTERN AUSTRALIAN WILDLIFE AUTHORITY IN SOUTH WESTERN AUSTRALIA

SUBMISSION TO THE WA DEPARTMENT OF FISHERIES AND WILDLIFE BY THE WAFGA INC ON THIS PROGRAMME

1. <u>INTRODUCTION</u>

This submission is based on discussions by R. Burking, B. Kneebone and R. Motteram of the WAFGA, with Messrs J.A.K. Lane and D. Munro of the Department of Fisheries and Wildlife on February 2 1981.

Since the formation of the Association's Research Section in 1973, attempts have been made in various forms to assess the potential of many of the wetlands in Western Australia. However, through lack of manpower and considerable travelling expense, it was decided to concentrate its efforts on a small number of private wetlands used by the Association in open duck seasons, i.e. Yealering, Taylors Lake and Emu Swamp.

An inventory of Western Australian wetlands is regularly updated by the Research Section, but again, manpower and travelling expenses are the limiting factor.

The Association welcomes the proposal to assess the waterbird usage of wetland nature reserves in Western Australia and wishes to submit a number of proposals and suggestions to the scheme

2. WETLAND COMPLEX SYSTEM

The WAFGA has always favoured the use of the wetland complex system for wetland studies in the South-West Land Division. Proposals for modifications were submitted to the Department (Burking et al 1981). The Research Section of the Association would like to see the complex system used in the study of waterbird usage and incorporated in any data analysis. Previous studies have shown that some species of waterbirds tend to colonise certain complexes depending on water quantity and quality. It is hoped that future open duck seasons may be based on complex data in relation to wetland depth and population of species, as well as rainfall in specific meteorological districts.

Initially at least one wetland per complex should be assessed and this gradually increased as the number of interested people enter the scheme, to include all wetlands if possible.

3. PROTECTED SPECIES

Since the closure of Lake Toolibin in the Narrogin wetland

Joseph Redel

complex to duck shooters, because of certain species considered to be rare or endangered, WAFGA members have declined to report observations of Freckled Duck on a number of wetlands throughout the South-West Land Division. The attitude has been that if Freckled Duck are reported, closure of the wetland will result, once again reducing the number of game reserves to duck shooters. The Association is most concerned that, if a large number of wetlands are surveyed on a regular basis, sightings of Freckled Duck will present new data to the Bird Committee of the WAWA which may lead to more wetland closures. Whilst the Association is very concerned with conservation and the regeneration of waterfowl habitat, the worry of closure of wetlands to shooters remains.

It is extremely important that some policy be issued by the ——Bird Committee of the WAWA on the Freckled Duck situation and if some wetlands are to be closed, consideration be given to opening up some wetlands now classified as sanctuaries. Following a concentrated five year study, the WAWA should be better equipped to present facts on the situation.

4. MODIFICATION OF WETLAND SANCTUARIES

During the period that Dr T.L. Riggert was associated with waterfowl research within the Department of Fisheries and Wildlife, a number of sanctuary lakes were declared within specific areas to allow a relief from the pressure during the opening weekend. No data are available as to why these specific wetlands were selected, with the exception of Lake Toolibin due to the suspected breeding of Freckled Duck and White Egret.

It is hoped that following the intensive five year survey programme some modification of sanctuary wetlands could be studied with the view to allowing more suitable areas for duck shooters, whilst offering some form of refuge for waterfowl.

As agreed by both the Department of Fisheries and Wildlife and the WAFGA, it is only during the opening weekend that the shooting pressure on waterfowl is experienced. This is appreciated and allowed for in the proposal on standard-isation of open duck seasons in Western Australia (Burking et al 1979). It is accepted knowledge that only a small percentage of duck shooters who front up at opening, visit the wetlands after that — only the dedicated hunters. The question is then raised that, following the initial pressure at opening (allowed for by the 6 p.m. versus the 6 a.m. opening times), some of the sanctuary lakes be opened for the benefit of the genuine hunter later on in the season.

Large open wetlands such as Big White in the Narrogin complex, Lake Dumbleyung in the Dumbleyung complex and Lake Parkyerring in the Wagin complex, due to their size, must be

considered as sanctuary lakes and, in view of this, some of the limitations which exist at present could be investigated.

5. MODIFICATIONS TO OPEN WATERFOWL HUNTING SEASONS

As discussed briefly in Section 4, following the five year study period of waterbird utilisation of wetlands, new ideas and proposals will arise. A mass of information still remains to be collected on WA wetlands, part of which is under way through the wetland depth gauge and water quality study.

With greater knowledge being gained on the usage of wetlands by waterbirds, some changes to legal species and bag limit numbers may be possible, together with the inclusion of other species such as the Pink-eared Duck, which is sighted in ever increasing numbers on many wetlands in the South-West Land Division.

6. SURVEY FORMS - DESIGN AND FIELD USE

During January (1981) Mr J.A.K. Lane of the Waterbird Research Unit, discussed with Mr Burking the type of survey forms best suited for observers in the field. In view of the fact that people from various organisations will be involved, it was considered essential to provide a form applicable to each of these. From experience with Research Section members of the WAFGA it has been found that only one side of a sheet should be used. Many observers forget to turn the page in order to complete the data required.

With the standardisation of size A4 paper, it has the tendency to create problems when using one side only. However, in our opinion one sided forms are best.

With relation to data, it is felt that by some modification of the form designed by the Fisheries and Wildlife Waterbird Research Unit, and the inclusion of the computer type recording system introduced by the RAOU (well known to the Bird Atlas people) a form could be designed.

The WAFCA feels that water depth according to the gauge is a most important aspect in relation to waterbird usage.

In order to utilise the RAOU bird numbering system it is most important that a "key" be provided as with the "Atlas" recording.

The WAFGA has included two forms which may be useful in the final design. Both of these utilise the F & W and the RAOU systems, but No. 1 lists the actual waterbird reference numbers that may be sighted and No. 2 allows spaces for observers to fill in the species number. It should be appreciated that both forms are somewhat freehand and require "straightening up" but should serve as a guide. No doubt the

Controller of the scheme when appointed will make this high on his list of priorities. However, further discussion would be appreciated.

7. WAFGA PARTICIPATION

As discussed in Section 1, the Association welcomes the opportunity for an intensive study of our Western Australian wetlands to be carried out. It is hoped that members at present not participating in the Wetland Depth Gauge study may be able to contribute. At present some 20 wetlands are being surveyed by members in association with the F & W on a bi-monthly basis, the WAFGA being involved in January, May and September each year. On this basis, members have been able to cope and look forward to the three trips per year. The Association's programme is based on these three months and any increased involvement may produce problems. Research members have indicated that they wish to continue the surveys at present assigned to them and could include the requirements of the waterbird utilisation study.

Apart from the wetlands within the Depth Gauge scheme, a few members are studying wetlands relatively close to their place of residence purely on a hobby basis.

As indicated by Mr Lane, it is hoped that the RAOU Atlassers, following the final Atlas year of 1981, will be invited to participate in the new programme.

It is hoped that wetlands not under the control of the WAWA, but surveyed at regular intervals could be included in the RAOU/F & W study. One problem that arises is that not all of these wetlands are surveyed on a regular basis, but data obtained on waterbird usage and movements could be useful.

8. <u>FUTURE PROGRAMMES</u>

During discussion, Mr Lane made mention of two ideas that could provide useful information following the five year waterbird usage programme. These were:

- (a) Annual Abundance Index Survey of waterfowl in the South-West that could be made each year in the months of February and April.
- (b) Nesting and Breeding Habitat Survey of Game Species including brood size.

To add to these two suggestions is the instigation of an artificial nesting box study using various types of designs in different habitats. At present the Association is studying a number of designs at the Bayswater Wildlife Sanctuary and the Yealering location known as Gilman-Shipleys Swamps.

All could provide very useful information on the waterbird scene in Western Australia and it is hoped that consideration can be given to these suggestions in future years.

9. <u>CONCLUSIONS</u>

Any programme designed to provide information on wetlands and waterbirds in general can only provide greater appreciation by both conservationists and hunters. The WAGFA feels that this is the start of a new era in the understanding of a very scarce commodity. The points outlined in this submission by the Association hope to provide some ideas for future wetland management and a more realistic attitude to hunter-Departmental relationships in respect to open duck seasons. The Association's support is strengthened by a copy of a recent letter to the Hon Minister for Fisheries and Wildlife (see Appendix 5).

10. ACKNOWLEDGEMENTS

The Association would like to express its appreciation to the Department of Fisheries and Wildlife for allowing us the opportunity to discuss the programme, especially to Messrs Jim Lane and Don Munro for their friendly and informal attitude.

2nd February 1981

G. Masters, Esq., M.L.A., Minister for Fisheries & Wildlife, 108 Adelaide Terrace, PERTH. W.A. 6000

Dear Sir,

Firstly, we would like to record our appreciation of the communications flowing between our Association and yourself as Minister for Fisheries and Wildlife and your Department and its officers.

It goes without saying that we are extremely disappointed with the lack of duck shooting season in the south west land division this year. However from information available, we do appreciate the decision which has been made and of course, our Association will abide by your decision.

It has become extremely obvious that we must know more about the wetlands and their surrounding ecology and in an attempt to raise awareness of conservation and related matters, the Field and Game Association throughout Australia is distributing copies of our latest Wildlife Management publication, a copy of which is enclosed herewith. We particularly recommend the reading of - Habitat - Its Role in Wildlife Management (Mr. P. Rawlinson).

We are pleased to advise of the continued good relations with your Department, and in particular with Jim Lane and Don Munro in the research section. One matter which has been discussed recently is water bird usage of wetlands in nature reserves in Western Australia.

We believe that consideration is being given to utilising some of the Wildlife Conservation Funds in this regard and I feel that it is our duty to point out that the original proposal, initiated by duck shooters with regard to these funds, was aimed at the purchase of areas which would be of benefit to water fowl and duck shooters in pursuing their sport. There should be correspondence on your files, addressed to Mr. MacKinnon, the then Minister for Fisheries and Wildlife, showing that Roy Holtfreter of Northam was a leader in the original move.

The validity of spending these funds on the proposed research has been questioned within our Association however I pointed out to Mr. Holtfreter that our research team has dreamed for many years that such a project could be undertaken but due to the prohibitive cost, it was felt that before such a purchase be made that effective knowledge of the total situation was essential; the study proposed by Jim Lane should achieve this knowledge.

I would like to make the following observations and express our support:-

- 1. Because of our faith in Jim Lane and Don Munro and their ability both in research and to consider a balanced view of the duck shooting scene.
- Because of our liaison with Doug Arnold and the relevant Department and its members in in good standing and has steadily improved over the past few years.
- Because you have shown a willingness to communicate and co-operate with bodies such as ours and recognise our true desire for wildlife management.

In view of the above, we fully support the proposed study into "Waterbird Usage of Wetlands in Nature Reserves in Western Australia" and as President of the West Australian Field and Game Association, do express our wish to participate in such a scheme, should it come to fruition.

Yours faithfully, THE WEST AUSTRALIAN FIELD &GAME ASSOC. (INC.)

R. W. MOTTERAM
PResident

Encl.

ASSENDIX 6.

Assessment of Waterbird Usage of Wetland Nature Reserves Controlled by the Western Australian Wildlife Authority in South-western Australia

During 1979 and the early part of 1980, discussions took place between A.A. Burbidge, J.A.K. Lane, S.J. Cowling, S.J.J.F. Davies and M. Blakers about the possibility of using the RAOU's network of amateur observers to assess waterbird usage of wetlands in south-western Australia and a sample of those in the rest of the state. Such a project is seen by the research staff of the Department of Fisheries and Wildlife (WA) as a way of gathering information to assist in developing management programmes for wetlands under the control of the W.A. Wildlife Authority (WAWA).

The RAOU Field Investigations Committee see it as an excellent follow-up to the Atlas of Australian Birds, harnessing the considerable knowledge and enthusiasm of atlassers to a new and important project. The survey of waterbird usage of south-western wetlands might form a pilot project for a subsequent, or concomitant, national study.

The present paper incorporates material from several drafts produced for earlier discussions. It proposes a four year study with field work confined to south-west W.A. but incorporating the development of techniques suitable for use on an Australia-wide scale. Funds are sought to support the project through the Fisheries and Wildlife Department of W.A.

Aims of the Fieldwork

- 1. To obtain information on the use of wetlands by waterbirds in southwestern W.A.
- 2. To develop techniques, and train amateur observers in their use, for future monitoring of waterbird populations in W.A. and throughout Australia.

3. To experiment with census methods for Australian wetlands.

Aims of the Evaluation of Field Results

- 1. To provide information on waterbird usage to assist in the management of wetland nature reserves and in the resolution of user conflicts.
- 2. To assess the role and importance of the wetland nature reserve system in the conservation of waterbird populations.
- 3. To assess the efficiency and practicability of various waterbird census methods under Australian conditions.

Definitions

"Waterbird" is defined as any bird species dependent upon wetland environments for a major part of its life cycle. The definition does not include birds restricted to oceanic environments. Appendix 1 is a list of waterbirds compiled by the Working Group on Birds of CONCOM.

"Wetland Nature Reserve". The specific reserves to be covered would need to be listed and located during discussion between the Department of Fisheries and Wildlife and the RAOU.

Administration

The responsibility for the study would be taken by the Field

Investigations Committee of the RAOU through the Institute of Field

Ornithology at the Union's headquarters in Melbourne. A Field Officer

located in W.A. would be employed to administer the project, supervised by

the OICIFO. The Field Officer would have two main roles: to co-ordinate

the activities of amateur observers and to design, test and report on census

techniques. Data will be stored and analysed by computer to provide fast

and comprehensive feedback to interested bodies and to observers.

During the developmental stage of the project, administration would be primarily within W.A. If a national project is begun, routine administrative tasks will be undertaken in Melbourne.

Procedures

It is proposed that the Field Officer be appointed before the opening rains of 1981 (i.e. April, 1981). There are at present over 300 active atlasers in Western Australia. About a third of these are in metropolitan Perth, a third in the south—west of the state (bounded by lines through Perth and Southern Cross and Hopetown and Southern Cross) and a third in the rest of the state.

Year 1. A sample group of wetland nature reserves vested in WAWA will be selected for the development and evaluation of different counting techniques and for training observers in their use. The wetlands chosen will be those known to be good waterbird areas; they will provide a representative range of wetland types; and they will be accessible.

Much time will be devoted to training observers in the first year and to the development of suitable survey techniques.

Years 2, 3 and 4. All wetland nature reserves vested in WAWA will be surveyed. Each will be visited at least every 2 months and at times of particular interest (e.g. as they dry out in summer). All waterbirds will be censused. As observers become more expert, particular emphasis will be placed on breeding counts and on the quantitative assessment of which parts of each wetland are most used by which species. Conditions vary so much from year to year that three full survey years are seen to be needed to ensure reasonable coverage of seasonal variation.

Results

The RAOU will provide annual summaries of the information obtained and a final report at the end of the four years discussing the methods employed, the results, and their implications for management both of waterbirds and wetland nature reserves. The report will aim and present quantitative data on individual wetlands wherever possible to provide a base against which future surveys can be compared. Ownership of information needs to be resolved in discussion with the W.A. Department of Fisheries and Wildlife. A possible basis for discussion might be that information in the annual and final reports be freely available for use by both organisations; that WAWA and the RAOU have access to the data bank at cost; that the RAOU control and maintain the data bank and retain the right to sell information to third parties to cover the costs of so doing; and that the RAOU have the right to incorporate data from the project in the publication of a national survey of wetland usage.

Conclusion

As well as fulfilling its own aims and acting as a pilot study for a national survey of waterbird usage of wetlands, this project will provide training for amateur observers to participate in two other projects discussed by the Dept. of Fisheries and Wildlife and the RAOU ---- the monitoring of waterbird populations in south-western Australia and a study of nesting waterbirds. The practicality of these studies can be assessed during the course of the present one.

Budget and Timing

	1981	1982	1983	1984
Salary of Field Officer	9500	10000	11000	12000
Travel*	2500	3500	4000	4500
Stationery and Printing	2000	2000	2000	2000
Telephone and postage	2000	2000	2000	2000
Rent	1000	1000	1500	1500
Computing	1000	3000	30,00	4000
Administrative costs	1000	1000	1000	1000
Total	19000	22500	24500	27000
	-			

^{*} Travel costs include 2 return fares to Melbourne and a mileage allowance at 16¢/km. It is not envisaged that the RAOU should buy its own vehicle; if it did, the costing might have to be modified.

Travel costs are expected to rise steeply year by year.

Species from the following families were included in the list prepared by the Working Group on Birds of CONCOM.

Grebes

family Podicipedidae

Pelicans

Pelecanidae

Darters

Anhingidae

Cormorants

Phalacrocoracidae .

Herons, egrets and bitterns

Ardeidae

/ Storks

Ciconiidae

Ibises and spoonbills

Threskiornithidae

Swans, geese and ducks

Anatidae

Rails, crakes and water-hens

Rallidae

Cranes

Gruidae

Jacanas

Jacanidae

Painted Snipes

Rostratulidae

Plovers and dotterels

Charadriidae

Stilts and avocets

AND THE RESERVE OF THE PARTY OF

Curlews, sandpipers and snipes

Scolopacidae

Recurvirostridae

Gulls and terns

Laridae

Species from the following families should also be included in a wetland usage survey.

Hawks, eagles and harriers

Accipitridae

Old world warblers

Sylviidae
