

Family Austroperlidae

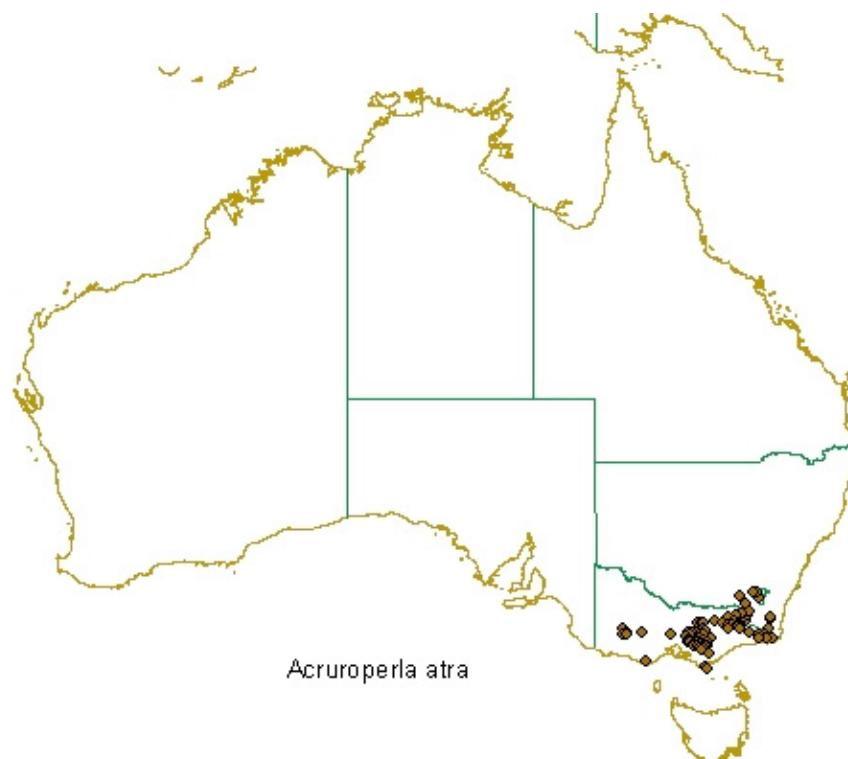

Habitat Profile for *Acruroperla atra* (Samal)

Acruroperla atra (Samal) was recorded from 278 samples mainly in Victoria but also in southern New South Wales and the ACT.

C. atra was recorded from streams at a wide range of altitudes (20-2020m) above sea level (Chart a) which showed a bimodal distribution around 300-5090m and >1000m. The lower altitude results were predominantly from Victoria while the high altitudes were in alpine Victoria, NSW and the ACT. The streams were generally close to the stream source particularly in NSW and the ACT (usually <20km) (Chart b) and the substrate was dominated by cobbles, pebbles, gravel and sand with <20% detrital cover (Chart c). Streams were generally <20m wide (Chart d), depth was <0.4m (Chart e) with low alkalinity (Chart f) and low conductivity <320 μ S/cm (Chart g).

The following generalities can be made about the other parameters listed in the Table: wide range of temperature (2.2-22 °C), pH was circum-neutral, range 4-8.3 and very low turbidity (0.3-13.2 NTU).

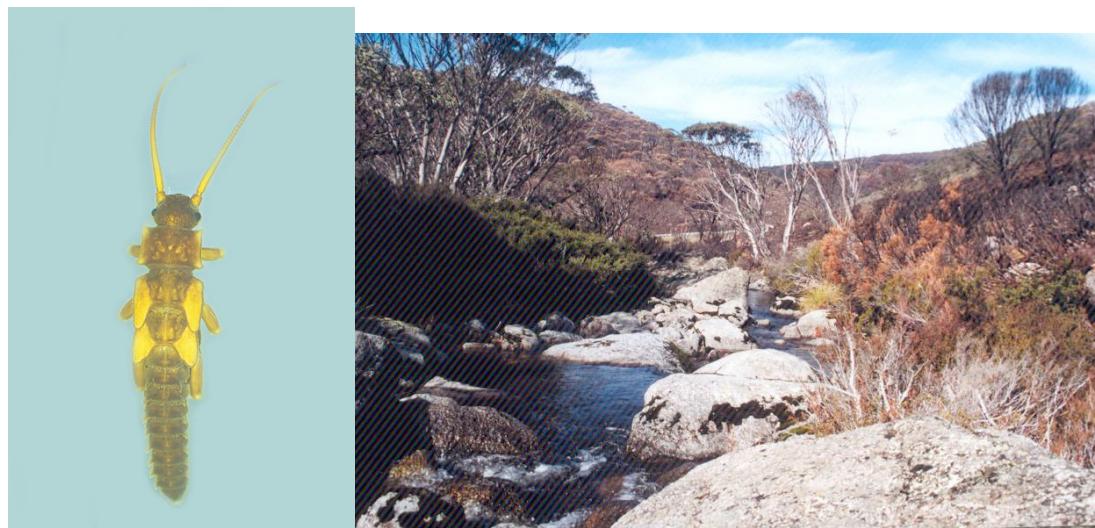

Mean, median and range for selected physical and chemical parameters and habitat categories are given in the Table.
