**Microclimate and soil properties of older bilby diggings
at Lorna Glen rangelands restoration project.**

Tamra F Chapman

Department of Environment and Conservation.

Abstract:

For rangeland areas that have been set aside for conservation, ecosystem processes can be restored by re-introducing native fauna that dig while foraging. This study investigated the microclimate and soil properties of three year old bilby *Macrotis lagotis* diggings in Western Australia's goldfields.

*Celebrating diversity:
people, place and purpose.*
