Forests Department, Perth, 7th September, 1936.

The Honourable Minister for Forests.

Sir,

I have the honour to transmit herewith my Report on the operations of the Department for the year ended 30th June, 1936.

I have the honour to be,
Sir,
Your obedient servant,
S. L. KESSELL,
Conservator of Forests.

4

Annual Report on the Operations of the Forests Department for the year ended 30th June, 1936.

INTRODUCTORY REMARKS.

Steady improvement in the condition of the timber industry and very considerable advances made in reforestation work as a result of large Unemployment Relief grants are important features of this Report for the year ended June 30th, 1936.

The volume of sawn and hewn timber produced amounted to 13,133,000 cubic feet, valued at £1,700,000. This represents an increase of 18 per cent. over the production of the previous year. At the end of the year there were 53 sawmills drawing their log supplies from State Forests and other Crown lands, with a total log intake for the twelve months period of 28,010,000 cubic feet. In addition there are over 30 mills, mostly small fruit case mills, operating on private property, with an estimated total log intake of 2,500,000 cubic feet per annum.

The intake capacity of existing mills is sufficient to handle the total volume of log timber which may be removed annually from our forests within the limits of sound forest management, and, apart from certain adjustments of cutting between districts, for which provision is made under approved Working Plans, there is no scope for the erection of further sawmilling plants in our main forest regions. With a vigorous policy of reforestation and efficient fire protection measures, the State may look forward to the maintenance of the steady production of timber for internal requirements and a balance of special sizes for export for very many years to come, but any attempt to increase the rate of exploitation beyond the calculated permissible cut of the forests must lead in a comparatively short time to a disorganisation of markets and serious unemployment problems in the industry through inability to maintain the output.

It is interesting to note that 86 per cent. of the increase of 1,976,000 cubic feet of timber produced during the year has been absorbed within the State. Even with the improved local demand for scantling sizes for building and other similar purposes, existing markets for small cross sections and short length timber are not able to absorb at profitable rates the quantity being produced. With improved milling practice and better supervision at many mills, the production of this class of material from waste which goes into firewood or over the fire chute might be increased considerably. Developments in the more general use of short length end matched flooring boards is a move in the right direction and indicates what sawmillers and timber merchants may accomplish by co-operative effort in finding new uses and extended markets for good timber which to-day is regarded practically as offal.

The extensive export trade carried on in poles, piles and hewn beams in the years prior to the war, and the lack of any adequate reforestation measures until recent years, have left our Jarrah forests seriously deficient in immature trees which will be needed to supply mill logs in the comparatively near future, and it is becoming a problem of increasing difficulty to find poles and piles for necessary Public Works within the State without further depleting our understocked forests. Supplies on private property are becoming exhausted rapidly, and in future contractors will have to be prepared to rail the bulk of their requirements from the extreme South-West.

Seventy-six per cent. of the total production of hewn sleepers for the year were obtained from private property. It is questionable how much longer this source of supply will last, and suitable areas for the operation of sleeper cutters on land under the control of the Department are very limited indeed. A recent development which promises to assist considerably in maintaining the sleeper output and in finding work for men who have followed the hewing industry for many years past is the establishment of small portable milling plants specially designed for the production of sawn sleepers. These plants have proved their capacity to work up logs unsuitable for hewing and, for this reason alone, are able to obtain a very much greater recovery of sleepers per acre than is possible by the use of the broad axe, both in Jarrah and Wandoo forest. In many instances they are able to work over sparse forest cut out by hewers. Motor transport has solved the problem of bringing in to central plants of this type from considerable distances logs cross-cut in the bush to sleeper lengths, but the design of special benches and log handling gear under the mill roof is a technical problem deserving more attention than it has received to date. This would appear a matter worthy of attention by the large sawmilling companies purchasing the output of these small sleeper mills.

Another aspect of the timber industry which has attracted some public attention during recent months is the production of Jarrah and Karri cases for the export fruit industry. The value of cases used last year for fruit sent overseas amounted to £40,000. Apart from the goodwill and advertising

value of the red hardwood case to the fruit grower, this business represents to the sawmiller an important avenue for the disposal of short length and small size material, much of which would otherwise find its way over the fire chute. In order that sawmillers may be able to reorganise their plants to cope with the greatly increased demand for export fruit cases made from seasoned timber, it is essential that growers and exporters of fruit decide, in consultation with sawmilling interests, on a standard design of case for some years ahead, and, if this is done, there is no reason why the whole of the anticipated case requirements should not be produced in existing mills largely from waste material.

Reforestation operations have been extended during the past twelve months on a considerably larger scale than during any previous period in the history of the Department. Of the £180,750 made available for this work from Relief Funds during the year, the Commonwealth contributed £80,000. As a result of this expenditure approximately 1,000 men have been provided with work in the forests throughout the year on the usual relief work basis. The main work undertaken has been the regeneration of cut over Jarrah forest, and 95,830 acres have been given silvicultural treatment which will secure a vigorous growth of young Jarrah by natural regeneration. Associated with this work it has been necessary to open up some 670 miles of roads and tracks for access and fire control purposes. The total area of Jarrah forest regenerated amounts now to 349,600 acres.

The fire control organisation of the Department has been extended and improved. Two new lookout towers were erected, 109 miles of telephone line constructed, and 32 additional houses built for the accommodation of resident staff and workmen in the forest. Practically all important centres are now equipped with motor transport, and the latest type of fire-fighting equipment. New methods of detection and suppression have been evolved by specially equipped research stations, and fire weather forecasting has been brought to a considerable degree of efficiency. Despite a long dry season fire losses were again negligible, the area burnt being only 0.05 per cent. of the area under protection. No losses were sustained on any of the plantation areas, which now extend over 20,000 acres in eight different districts.

In the Narrogin District an additional area of 1,570 acres was sown with the seed of Brown Mallet (Eucalyptus astringens). These plantations, which now extend over 8,180 acres, continue to show very rapid and healthy growth, and recent reports indicate that this species will produce valuable timber as well as tannin bark. The wood is the most promising substitute for American hickory yet tested in Australia.

The area of softwood plantations was increased by 1,056 acres during the year, bringing the total area up to 10,260 acres. Research work to determine the most satisfactory and economical methods of pine establishment, the soils best suited to different species, and methods of correcting unsatisfactory growth on certain sites has yielded a number of important positive results during the past twelve months, which will lead to considerably improved planting and tending technique on all plantations.

The area of regenerated and planted forest carrying a crop of young trees in seedling to sapling stage is now approaching 400,000 acres. In this, the State has a growing asset of great value, but its care and protection is a serious responsibility. While the young forest is growing to a merchantable size, the revenue derived from a careful regulation of the log output from the depleted reserves of mature trees remaining may be expected to pay the cost of protecting and tending the immature areas. It is desirable that the Government and the people of the State should realise the contingent liability that these young forests represent, particularly in their very early years, and some adjustments with regard to claims by the Treasury on account of mounting interest charges on relief funds expended by the Department will be necessary in the near future if the amount credited annually to the Reforestation Fund, being three fifths of the net revenue of the Department, is to prove sufficient to meet these liabilities.

The resignation of the Hon. P. Collier, M.L.A., from the Cabinet has meant the loss to the Department of a Minister who has played a very large part in shaping the forest policy of the State during the past 20 years. Mr. Collier took a keen interest in the framing of the "Forests Act, 1918," which established the Department. Since 1919 he has held the portfolio of Minister for Forests in four Governments covering a period of over nine years. During his various terms of office many important developments have taken place and his sympathetic and far-seeing guidance in these matters has played a very large part in establishing forest management on a sound basis in Western Australia.

CHAPTER I.

THE FOREST AREA.

(1)—State Forests (Forests Act, 1918).

One new State Forest comprising 3,372 acres in the Mallet habitat was dedicated during the year. State Forests previously dedicated were amended by the addition of 762 acres and by the excision, with the approval of Parliament, of 403 acres. The total area of State Forests, therefore, shows an increase of 3,731 acres when compared with the area as at 30th June, 1935.

Particulars of the areas dedicated are set out in the following statement:-

		_			June, 1935.	June, 1936.	Increase.
					acres.	acres.	acres.

		Total		•••	 3,134,931	3,138,662	3,731

(2)—Timber Reserves (Forests Act, 1918).

One additional timber reserve, comprising 3,280 acres, around Palmer's Find townsite, was declared during the year, and an amendment to figures previously given in connection with the reserve at Reedys increased the area of that reserve by 4,240 acres. The total area of timber reserves has, therefore, been increased by 7,520 acres to 1,764,605 acres.

The following statement sets out the present position of the reserves:-

								June, 1935.	June, 1936.	Increase.

CHAPTER II.

REVENUE.

The Revenue of the Department amounted to £143,158, compared with £119,232 for the previous year.

The rebates of 20 per cent. on royalties payable on log timber and 5s. per load in the square on sawn timber exported beyond Australia were continued. In addition, inspection fee rebates of 25 per cent. on all sawn timber, including sleepers, and 25 per cent. on hewn sleepers for export were allowed. The amount so rebated =

"	Log Timber Sawn Timber exported Inspection Fees	 	 	
				£32,791

Log royalty amounted to £88,479, an increase of £20,409 on the amount received from this source last year. Sandalwood revenue showed an increase of £2,867 over last year's figure.

Figures in columns (1), (2), (3), (4), (8), and (10) are in the round based on full volume measure. Figures in columns (5), (6), (7), (9), and (11) are the volumes of sawn or hewn timber measured in the square.

* Includes 337,991 cubic feet Wandoo; 133,464 cubic feet Sheoak; 85,403 cubic feet Blackbutt; 59,450 cubic feet Pine; 58,679 cubic feet Tuart; 2,951 cubic feet Marri. † Includes 481,186 cubic feet Wandoo; 1,716 cubic feet Blackbutt.

SAWMILLING AND HEWING.

During the past twelve months the timber industry in this State has shown a very substantial improvement. The volume of sawn and hewn timber produced amounted to 13,133,000 cubic feet, the value of which is estimated at £1,700,000. This represents an increase of 18 per cent. over the production for the previous year. Two of the large mills that had been closed down for some time, owing to the trade depression, re-opened during the year, and a number of new mills for the cutting of fruit cases and sleepers commenced operations. There are now 53 saw mills drawing log supplies from Crown lands and from 30-40, principally fruit case mills, operating on private property. The quantity of log timber taken to the mills during the year was 30,498,000 cubic feet, or approximately 5,689,000 cubic feet more than for the previous year. Of the mill log intake 28,010,000 cubic feet came from Crown lands and 2,488,000 cubic feet from private property.

Approximately eight hundred hewers were employed throughout the year in the production of sleepers and produced 2,867,600 cubic feet of hewn timber, being 47,500 cubic feet in excess of the previous year's production. Seventy-six per cent. of the hewn output came from private property. Included in the production of hewn timber were 481,186 cubic feet of Wandoo. This timber is becoming increasingly popular for local railway sleepers and bridge timbers, owing to its durability, and some idea of the increasing demand for hewn Wandoo can be gathered from the following figures showing the annual production during the past four years:—1932-33, 5,687 cubic feet; 1933-34, 88,219 cubic feet; 1934-35, 284,948 cubic feet; and 1935-36, 481,186 cubic feet. There has also been a similar increase in the production of sawn Wandoo and several small mills are now exclusively engaged in cutting wandoo sleepers.

The respective quantities of sawn and hewn timber, measured in the square, obtained from Crown lands and private property for the past two years are set out in the following statement:—

			\mathbf{Fr}	om Crown Land	s.	From Privat	te Property.	Estimated
Year.		Sawn Timber other than Sleepers.		Sawn Sleepers.	Hewn Timber.	Sawn Timber, including Sleepers.	Hewn Timber.	Value of Timber obtained.
1934–35			cub. ft. 6,794,190	cub. ft. 852,099	cub. ft. 927,567	cub. ft. 690,503	cub. ft. 1,892,533	£ 1,450,000
1935–36			7,788,648	1,618,844	678,025	857,903	2,189,633	1,700,000

TIMBER EXPORTS.

The overseas demand for our hardwoods has been maintained, and timber amounting to 5,598,180 cubic feet, the declared value of which was £679,522, was exported during the past year. Although these figures show a slight increase on the export trade for the previous year, it would appear that the bulk of our increased production has gone into local consumption.

Exports of railway sleepers and dressed timber show a slight falling off, but this has been offset by an increase of 405,000 cubic feet in undressed timber.

The Eastern States of the Commonwealth were again the principal buyers of our hardwoods, and took timber to the value of £176,462. This amount is considerably below their purchases for the previous year (£221,654), but on this occasion it includes sleepers to the value of only £5,857, whereas during the previous year sleepers to the value of £84,710 were obtained from this State. The principal overseas buyers are set out hereunder, the figures in brackets representing the value of the timber acquired by them during the previous year:—

				£	£
South African Union		 	 	125,375	(83,938)
		 	 	119,025	(104,797)
Egypt		 	 	86,388	(32,878)
China	••	 	 	58,309	(77,980)
New Zealand		 	 	29,218	(22,706)
Iraq		 	 	21,608	(15,447)

A detailed statement of the timber exports is given in Appendix 2a of this report. This statement does not take into account the quantity of timber required in connection with the fruit export trade, which during the past year used fruit cases to the value of £40,000.

TIMBER IMPORTS.

The value of timber and wood manufactures imported during the year amounted to £228,451, details of which are given in Appendix 2b. Compared with the imports for the previous year there has been an increase of £17,395. Dressed and undressed timber amounted to only £79,180, the remainder representing plywoods and veneers, furniture and other wood manufactures which account for the whole of the increased value of imports. Sixty-seven per cent. of the timber and wood manufactures imported are stated to have been of Eastern States origin.

TIMBER INSPECTION.

The quantity of sawn and hewn timber submitted to the Department for inspection was 3,992,875 cubic feet, which is slightly less than the quantity inspected during the previous year. This is probably due to the export of a smaller quantity of railway sleepers.

Piles and poles totalling 67,262 lineal feet were also inspected.

The system introduced towards the end of 1934 for the grading of flooring for the Metropolitan market was continued, but it is regretted that full advantage has not been taken by all sawmillers of this arrangement. The quantity of merchantable flooring inspected and branded by the Department during the year was 567,900 lineal feet.

The revenue received from this branch of the service amounted to £6,376.

SANDALWOOD.

The Sandalwood Export Committee appointed in 1932 to manage and regulate the sandalwood export business in the States of South Australia and Western Australia, and the selling policy and prices in China, has functioned very satisfactorily, with the result that during the past four years regular though limited pulling operations have been maintained, excess stocks have been gradually liquidated, and the market in China has been stabilised. Towards the end of the year Mr. E. J. Field, Director of Lands, South Australia, a member of the Committee, visited China to investigate a number of matters affecting sandalwood marketing problems.

The quantity of sandalwood pulled annually for export is now governed by the actual deliveries of wood from the "go-downs" in China, and as a result of the decreased consumption of wood in China due to the general depression in the country, disastrous floods, and other trading difficulties, the quantity of sandalwood pulled in this State for export last year was slightly below that obtained for the previous year.

During the year under review 169 orders were issued for the supply of 1,574 tons of sandalwood, including 85 tons of logs for oil distillation purposes. The wood supplied was of fairly good quality, and although a number of small reductions in the price to the getters were authorised, principally for poor cleaning, the price paid for export logs averaged £15 17s. 7d. per ton f.o.r. Fremantle.

Thirty licenses were issued under the provisions of "The Sandalwood Act, 1929," for the disposal of approximately 100 tons of wood from 82 private property locations.

The quantity of sandalwood obtained from all sources during the year ended 30th June, 1936, is set out in the following statement:—

Locality.	For Oil Distillation.	For Export
rom Crown Lands, South of 26th parallel of South Latitude rom Crown lands, North of 26th parallel of South Latitude rom Private Property	tons. 317 66 	tons. 1,176 71
Total	383	1,247

Sandalwood exported for the year amounted to 1,592 tons, valued at £44,916.

Sandalwood for Oil Distillation.

The sandalwood used locally for oil distillation consisted chiefly of roots and butts sawn from the logs pulled for export. Three hundred and seventeen tons of these roots and butts were delivered to distillers, and 66 tons of logs from Crown lands North of the 26th parallel of South latitude were used for oil distillation. The quantity of sandalwood oil exported during the year was 27,010 lbs.

OTHER FOREST PRODUCE.

Mining Timber and Firewood.

The increased demand for firewood and mining timber for both domestic and mining requirements and the reservation of suitable areas of timber for pastoral requirements made it necessary for the Department to undertake extensive reconnaissance work to locate timber and firewood supplies in goldfields areas, and to more closely supervise and regulate operations with a view to protecting the interests of all parties concerned, while insuring that timber is being cut and utilised in the most economical manner.

Early in March a Forester was appointed with headquarters at Wiluna, where a commencement on this classification work was made. At this centre the work was of an urgent nature owing to the decision of the Wiluna Mines to treat ore from certain leases by a smelting process estimated to require about 600 tons of charcoal per month, which the company desired to obtain locally from mulga timber.

In addition to supervising the work of timber getters, 275,000 acres of country has been classified around Wiluna. This work has shown that there is a large area of country carrying from ½ to 1 ton of mulga per acre, which, if systematically worked over, will provide supplies of charcoal and firewood for some years ahead without interfering in any way with pastoralists' operations or requirements.

A similar classification has been carried out over approximately 150,000 acres in the Menzies, Comet Vale, Broad Arrow and Laverton districts.

The system of issuing forest produce licenses over definite areas on a royalty basis has been continued, and action was recently taken to bring the royalties payable under such licenses throughout the goldfields on to a uniform basis. Although in some instances this adjustment of royalties may have resulted in comparatively small immediate increases in the cost of production of firewood and mining timber, the work now being carried out by the Department in closely supervising the operations of timber getting and eliminating wasteful methods should tend to keep down the cost of future supplies, and greatly extend the life of the firewood and mining timber business in many localities.

To assist the holders of mining leases whose operations are on a small scale, and who desire to cut their own mining timber, a form of quarterly license was introduced. This license can be obtained at a fee of 10s. by any lessee of a mining lease requiring for his own use not more than 900 running feet of mining timber per quarter.

The consumption of mining timber and firewood on the goldfields for the past year amounted to 16,722 tons and 459,312 tons respectively. Compared with the previous year these figures show increases of 3,000 tons of mining timber and 51,000 tons of firewood. Approximately 800 men are engaged at the present time in supplying mining timber and firewood on the Goldfields.

Piles and Poles.

The supply of piles and poles for essential public works in this State is becoming an increasingly difficult problem. In the past contractors have been able to obtain their supplies to a large extent from private property, but this source of supply is becoming exhausted, particularly for long length piles, and contractors are now looking to Crown lands for this class of timber.

While the supply of piles and poles for local requirements must be-met, any pile getting in the immediate future may be expected to conflict with the principal objective of the Department, which is the maintenance of log supplies for the sawmilling industry. The position is serious, owing to the shortage of age classes nearing maturity in the Jarrah forest. Particularly in those more accessible districts where pile getting was extensively followed in past years, it will be many years before the cut-over forest can be worked over again by saw mills other than small case mills. The position is at present being closely investigated by the Department, to ascertain the extent and location of pile supplies on Crown lands. From Crown lands last year 8,361 piles and poles totalling 184,392 lineal feet were obtained, the number being 677 greater than for the previous year.

Mallet Bark.

Two thousand seven hundred and thirty-three tons of Mallet bark were obtained last year from Grown lands and private property. The quantity exported amounted to 1,271 tons valued at £12,237. Of the bark exported 86 per cent. went to the Eastern States of Australia.

FOREST OFFENCES.

Eighty-eight forest effences were reported by officers of the Department during the year, most of which were of a minor nature. Proceedings were taken under the Forests Act in 11 cases, and in each instance a conviction was recorded. Fines, costs and damages amounting to £110 were imposed. The remainder of the offences were dealt with by the collection of royalties, damages, or the confiscation of the forest produce. Royalties, etc., recovered in this way amounted to £321.

Approximately 17 tons of sandalwood, valued at £483 were confiscated and sold for various breaches of the Regulations. After making compassionate payments amounting to £137 to cover cost of carting, loading, freight and other charges, the balance of the proceeds from the sale was paid into Consolidated Revenue.

FOREST PRODUCE NOT ELSEWHERE INCLUDED IN PRODUCTION TABLES, OBTAINED DURING YEAR ENDED 30TH JUNE, 1936, AND REPORTED TO THE DEPARTMENT.

CHAPTER III.

(1).—EXPENDITURE.

The expenditure on general administration, which includes both office and field work arising out of the enforcement of the Forests Act and Regulations and such direct revenue-producing activities of the Department as timber inspection, amounted to £22,289 compared with £18,524 last year.

The expenditure on reforestation works carried out as unemployment relief measures during the year amounted to £181,751, and of this amount £80,000 was contributed by the Commonwealth Government under the Commonwealth Aid to Forestry Scheme. A sum of £11,798 was spent on "C" Class relief work. Under these various schemes over 1,000 men were provided with employment in the forest throughout the year.

Three-fifths of the net revenue of the Department, exclusive of revenue from sandalwood, produced £41,997 during the financial year under review, and this has been credited to the Reforestation Fund in accordance with the provisions of Section 41 of the Forests Act, 1918.

The following statement shows the position of the Fund at 30th June, 1936:-

	Revenue for Year 1935-36 Less Sandalwood		• •		£ 143,158 22,580

FOREST SURVEYS.

Three survey camps operated during the year in Divisions 4, 8 and 10, using the Forester's compass and 5 chain band. In Division 6, co-operation with the surveyor attached to State Saw Mills was maintained. Surveys of compartment boundaries, base line, fire lines and general topographical features necessitated the running of 994 miles of traverse lines.

PERMANENT ESTABLISHMENTS.

During the year four new forest settlements were built, these were at Mundaring Weir, Dryandra, Gleneagle and Wellington. There are now ten forest settlements in existence. Additional houses were erected at Keenan Plantation, Applecross Plantation, Hakea, Wuraming, and in the Manjimup and Kirup Districts. In all 32 houses were built.

To assist in the protection of the large area of forest now regenerated, two additional fire lookout towers were erected—at Dryandra in the Mallet area and at East Kirup in the Jarrah forest. The latter tower, 112ft. high, was specially designed and built under the supervision of the Division of Forest Products of the Council for Scientific and Industrial Research. In its construction use was made of the latest development in metal connector design.

The telephone system connecting forest stations, fire lookout towers and Divisional offices was extended by 109½ miles. The network of roads and feeder tracks now covering the main forest belt was added to by the clearing of a further 675½ miles of old bush tramlines and hauling tracks.

ASSESSMENT SURVEY.

Assessments, soil surveys and type mapping were carried out over 65,350 acres; 32,700 acres in the Mundaring and Jarrahdale Districts were assessed for milling timber; 19,200 acres in the Manjimup District were type mapped. On the remaining 13,450 acres more detailed survey and assessment in connection with soil studies on plantation areas and stocktaking and assessment of the Jarrah bush was carried out.

		Totals					49,836	95,832	34,126	12,373	

The year 1935-36 was in one important sphere of silvicultural operations a record one—a very much greater area of Jarrah forest was regenerated than in any previous year in the history of the Department. The record established in the previous year was more than doubled, as indicated in the figures hereunder for the past four years:—

1932 - 33	 	 	 	30,920 acres
1933-34	 	 	 	29,411 acres
1934-35	 	 	 	44,586 acres
1935-36	 	 	 	95.832 acres

This very large increase was rendered possible by (1) the grant on a £ for £ basis of £100,000 by the Commonwealth Government towards the work; (2) the fact that during the previous year comparatively costly treatment in areas carrying heavy stands of malformed sapling growth was practically completed; and (3) the introduction without loss in efficiency of slight modifications in the details of treatment.

Steady progress is being made towards the achievement of the provisions of the General Working Plan for Jarrah laid down in 1929, and reforestation work in all centres is considerably ahead of schedule, but owing to the serious shortage of age classes from 30 to 90 years, this work can only affect yield calculations in the immediate future to a very limited extent. Since the Working Plan was approved in 1929 the area treated for regeneration has exceeded the area cut over for sawmilling by more than 126,000 acres.

The area logged over under treemarking control was 34,126 acres, compared with 30,402 acres for 1934-35. A decrease was shown in the area worked over by sleeper cutters—12,373 acres against 18,182 acres in 1934-35. The area on which the disposal of lop and top following sawmilling and hewing took place showed a marked increase, rising from 33,512 acres in 1934-35 to 49,836 acres during the current year.

The total area of Jarrah forest, which, following silvicultural treatment, has been restocked by a vigorously growing young crop and brought under intensive fire control measures, now amounts to 349 606 agrees

344

(b) Karri.

Although during the year no additional Karri forest was treated for natural regeneration, the system of fire protection was consolidated and extended by the clearing of 62 miles of firelines. On 127 acres where natural seed fall had been insufficient to stock the area, spot sowing with Karri was carried out.

The total area of Karri forest reforested and placed under fire control amounts to 16,102 acres.

(c) Mallet.

Along the Great Southern Railway, chiefly in the Narrogin District, poor poison lands unsuitable for agricultural purposes are being utilised for the propagation of mallet.

The area sown last year amounted to 1,574 acres, bringing the total area of plantation now established to 8,183 acres.

Apart from sowing, the main items of work during the year were the establishment of a settlement for forest workmen at Dryandra, the reconditioning and extension of the firebreak and fireline system, and the clearing of land for future sowing; 1,552 acres were cleared during the year, 103½ miles of firelines and firebreaks opened up, and 687lb. of mallet seed collected.

(d) Planting of Marram Grass.

The problem of the fixation of drift sands in the vicinity of the mouth of the Warren River was given attention during the year. On the south bank of the river, near Callcup ford, some 650 acres of dunes encroaching on good agricultural land and forest country were, in conjunction with the Lands Department, planted with seedlings obtained from areas of grass established in the neighbourhood some years ago. Use was made of unemployed labour on the work, and the cost was charged to Lands Department, Development of Agriculture vote.

* Jarrah only,

† Mallet.

Although during the summer of 1935-36 temperatures were moderate and comparatively cool weather was experienced, from the point of view of fire hazard, the season was the most dangerous encountered for some years. It was one of the driest summers on record, and that the long drought offset any advantage gained from cool conditions was well borne out by the fact that in April severe fires occurred in comparatively mild weather.

In spite of these adverse conditions losses from fire were low, which is more noteworthy when it is remembered that the area under complete protection was increased by approximately 90,000 acres during the year. Losses were .16 per cent. of treated or planted country, and .05 per cent. of the area under fire control. The only considerable area of regenerated forest burnt over was several hundred acres in one isolated centre, and was due to a series of fires lit by an incendiary. As much of this area was burnt under fairly cool conditions, it was not a complete loss.

Factors which influenced successful control during the year were the extension of the lookout system by the erection of two additional fire lookout towers at East Kirup and Dryandra, and the extended use in each Division of mobile fire-fighting units using water as a means of suppression. It is apparent from the rapid extension of silvicultural operations that the lookout system must be further augmented, and it is proposed to build four additional towers during the coming year, and as two of these will be in the southern portion of the Jarrah belt where no high hills afford extensive views, towers 100 feet high will be necessary.

A speedy and efficient means of fire suppression was provided by the establishment in each Division of fire-fighting gangs, using as transport light utility trucks carrying water and equipped with modern fire fighting equipment in the form of pack sprays, etc.

The system of fire detection from lookout towers and the equipment of the towers was standardised during the season. The use of panoramic plans was introduced to assist in the location of outbreaks.

The fire hazard research station at Dwellingup continued to collect valuable information in the relationship of weather conditions to fire hazard. A useful innovation in this connection was the daily broadcast from Perth National Station in the early morning of the fire weather forecast for the day, as supplied by the Dwellingup Station.

A heavy programme of main road, feeder track and fire line clearing was carried out during the year, thus providing for fire-fighting gangs quick and easy access to the scenes of outbreaks.

Totals		2,665	6,105	434	9,204	167	889		1,056	10,260

During the ten-year period in which a planting programme has been in force, the annual acreage aimed at, namely 1,000 acres, has been maintained, there now being 10,260 acres established on 24 plantations and experimental areas in the South-Western Division. The major portion of the planted area lies within a 40-miles radius of the Metropolitan Area.

The principal planting centres are the Metropolitan District, Busselton-Margaret River District, and Mundaring District, where 3,119 acres, 1,996 acres and 2,246 acres respectively have been planted.

Pinus pinaster and Pinus radiata still remain the chief species planted. During the winter of 1935 889 acres of Pinus pinaster and 167 acres of Pinus radiata were established, bringing the total acreages planted to 6,994 acres and 2,832 acres respectively.

On all classes of afforestation operations relief workers still continue to be employed, and up to 200 men were engaged during the planting season.

During the year 59,450 cubic feet of pine timber was removed from Crown lands and private property, an increase of 18,697 cubic feet on the previous year's figure of 40,753 cubic feet. Practically all this increased output came from Crown lands, the quantity cut on private property showing little fluctuation.

Of the total amount cut 44,014 cubic feet was produced at Mundaring Weir, where thinning operations in the older stands are supplying logs to a small local case mill. Forty acres were thinned and 15 acres clear felled at this centre. The remaining Crown land cutting took place on small areas at Hamel, Harvey Weir and Ludlow.

(4).—RESEARCH AND INVESTIGATION.

(a) Silviculture.

An area of 14,000 acres was covered by soil surveys in connection with a number of projects. Existing plantations and country proposed for planting with exotic conifers comprised half of this area, and the investigations thereon were of a very detailed nature, while less intensive surveys were conducted on the remaining 7,000 acres.

Analyses of chemical and mechanical properties of a large number of soils have been continued throughout the year, by arrangement with the Government Analyst and Mineralogist.

Further studies of the composition of the Jazrah forest were carried out, and local and regional characteristics defined. The aims of this investigation are to determine—

- 1. The composition of the forest (height variance, diameter classes and their distribution, basal areas, log length and volumes for the principal crop and associated species).
- 2. The range and distribution of quality classes.
- 3. Crown development distribution and relation to breast-high diameter.
- 4. The correlation of soil type with crop quality and ground vegetation types.
- 5. Methods of establishment of satisfactory regrowth under varying conditions, and its rate of development.

A large amount of valuable information regarding the timbered areas has been accumulated, much of which has been of immediate and direct value to officers in the field.

Experimental work in pine establishment has been continued at all plantations. The requirements of field trials with adequate replications and statistical reduction of results have been strictly observed, and in many cases the experiments have been repeated over a sufficiently long period to render them conclusive.

Experimental work in connection with the subsequent development of plantations after establishment has been continued and elaborated, considerable attention being directed to "sick" areas, or areas on which the trees have not maintained a satisfactory rate of growth.

A number of experimental plots were laid down to determine methods of satisfactorily establishing Jarrah and Karri on poorly stocked areas, the main lines of investigation embracing the use of seed and seedlings under various cultural and manurial treatments.

(b) Fire Protection.

Investigations in fire weather research were carried out at Dwellingup during the year, and data confirming previous observations concerning the relation of certain meteorological conditions to the rate of spread of forest fires was obtained. A daily forecast of fire weather conditions was prepared and transmitted from Perth National Broadcasting Station early each morning for the particular benefit of field officers.

The standardisation of methods of detection, description and recording of smokes, and the transmission of messages to the co-ordinating officer at each Divisional office was continued throughout the summer months. A new type of direction finder and sets of panorams were introduced on lookout towers.

Methods of fire fighting have been the subject of special study, with the result that considerable improvement in fire-fighting equipment, suppression technique, and organisation has resulted. The training of men in the special requirements for this work has been a valuable innovation.

(c) Utilisation.

The absence of the Utilisation Officer on long service and annual leave for four months, followed by the loss of the Assistant Utilisation Officer to the Division of Forest Products, Melbourne, has considerably affected the ground covered by the utilisation section in the past twelve months.

The outstanding work carried out during the year was the design and supervision of erection of a battery of seasoning kilns with the necessary yard layout and handling equipment for one of the milling companies. This plant has an estimated capacity of 1,800,000 super feet per annum in inch boards and on operations to date, the output for the first twelve months should easily reach this figure. This work was undertaken as part of the general plan for encouragement and assistance to the industry in adoption of modern methods of kiln seasoning. Prior to commencement of operations and for the first few months of running, the plant was managed by an officer of this Department temporarily on loan to the firm concerned.

Mechanical tests on Mallet (Euc. astringens) carried out by the Forest Products Division of the Council for Scientific and Industrial Research have shown that this timber should prove for general purposes to be a very satisfactory substitute for hickory.

Although less resilient and of greater weight than hickory, it is almost its equal in shock resistance and considerably stronger. For such purposes as handles it appears superior to those Eastern States timbers at present used in this manufacture.

(5).—ARBORICULTURE.

During the distributing season, which closed on August 31, 1935, 156,957 trees were disposed of from Hamel Nursery.

Of these 42,981 were sold to the public, 2,686 were supplied free to other Government Departments, public bodies, charitable institutions, etc., and 111,290 were consigned to the various Departmental plantations and arboreta.

The sales showed a slight increase (approximately 10 per cent.) on the figures for the previous year.

The order of popularity among the trees was the same as for the previous year, Pinus pinaster heading the list with sales of 10,200 and being followed by Eucalyptus cladocalyx (Sugar Gum) 6,840, and Pinus radiata (Monterey Pine) 5,200.

CHAPTER IV.

(1).—LEGISLATION.

"Forests Act Amendment Act, 1935."

An Act to amend Section 41 of the "Forests Act, 1918," was assented to on the 15th October, 1935. This amendment has been annually enacted since 1930, and excludes from the provisions of subsection (2) of Section 41 of the principal Act for a period of twelve months ending 30-6-1936 the whole of the revenue derived from sandalwood and provides for its transfer to Consolidated Revenue.

"Native Flora Protection Act, 1935."

An Act to provide for the protection of the Native Flora of Western Australia was assented to on the 7th January, 1936, and came into operation by proclamation on the 3rd April, 1936. This Act repeals the "Native Flora Protection Act, 1912."

The Minister for Forests is charged with the administration of this Act, and Forest Officers appointed under the "Forests Act, 1918" as well as officers of the Police Force are authorised to act as inspectors under the Act.

(2).—ADMINISTRATION.

The following staff changes were made during the year:-

(a)—Professional Division.

Mr. G. W. Wright, Assistant Utilisation Officer, resigned to take up a position with the (Commonwealth) Council for Scientific and Industrial Research, Melbourne.

(b)-General Division.

In connection with the Reclassification of the Service on the 1st January, 1936, nine "C" Grade Foresters became "B" Grade Foresters, one "C" Grade and four "D" Grade Assistant Foresters became "C" Grade Foresters and four "D" Grade Assistant Foresters became "C" Grade Assistant Foresters. Also one "B" Grade Forester was appointed and one "C" Grade Forester resigned, whilst four "D" Grade Assistant Foresters were appointed and one reverted to the position of Overseer.

During the year the appointment of a Workmen's Inspector under the Timber Industry Regulation Act was approved, and the former occupant of the position, which had been vacant for some years during the depression in the industry, was re-elected.

(c) Head Office Staff.

Only minor changes were effected in the staff at Head Office.

(d) Goldfields.

Owing to the increased demand for timber for fuel and development purposes in connection with the gold mining industry, a Forester and Assistant Forester (included in the above list) have been stationed at Wiluna, and a junior clerk has been added to the staff at Kalgoorlie.

In conclusion, I desire to place on record the loyal and efficient service rendered by officers of all branches of the Department during a busy and successful year.

Perth, 7th September, 1936.

S. L. KESSELL, Conservator of Forests.
