FOREWARD

The conservation of the flora of Western Australia depends at the level of biological communities on the creation of an adequate system of wildlife conservation reserves. The selection of areas for reservation is usually based on the recognition of vegetation types, supplemented and reinforced by knowledge of the distribution of endemics and rare species. This latter information is obviously essential for the conservation of the flora at the species level, whether by reservation, or by protective legislation, or by preservation through cultivation in botanic gardens or by storage of germplasm in seed banks.

In this most recent attempt to answer the superficially simple question "which are the rare species?", the authors have amply illustrated the problems posed in assessing rarity by an uncritical count of the number of specimens collected of each species. The possibly unwarranted conclusions, that might otherwise have been drawn, have been tempered with the history of botanical collection in Western Australia and the experience they and their colleagues have gained in the field.

In this they have not only provided a valuable summary of current information, but they have shown how future research into the flora may be most usefully orientated to fill the gaps in our knowledge which are now apparent. The low level of collecting activity in the more distant parts of Western Australia and the heavy travelling costs in particular necessary to remedy this, have long been evident. This study emphasises the floristic significance of the South West and the need for intensified study in this Botanical Province, where the conflicts between conservation and other land uses are most severe, the representation of many biological communities having been much reduced, but lying relatively close to the centres of population and of expertise, both amateur and professional. The authors acknowledge the need to revise periodically this review, which provides justification for further investigation of the unique flora of Western Australia, especially the South West.

INTRODUCTION

Western Australia, which covers over 2.6 million square kilometers, has a poorly known flora. Estimates of the total number of species range from 5,802 (Beard 1969) to 6,800 (Gardner 1958). The Kimberley Botanical Province (Map I) in the tropical north is floristically and ecologically similar to the western half of the northern Northern Territory, many of the plant habitats and many species being common to the two areas. The Eremaean Province which covers most of the central part of Western Australia, is a part of arid inland Australia and many species in this area are known to have a wide distribution. Exceptions are the Hamersley Range and North West Cape in the western part of the Eremaea. These areas have a distinctly different flora which when more fully documented will almost certainly reveal a number of restricted and possibly rare species.

The south-western corner of Western Australia is by far the area of greatest botanical interest in the State. It is characterised by a high degree of endemism and the fact that the endemic genera and species, especially the woody shrubs, are so common in almost all of the ecological formations. Beard (1965) lists 3,600 Angiosperms in the South-west Botanical Province; 68% of these are restricted to that province (Marchant 1973).

The listings presented here highlight the lack of knowledge of the Western Australian flora, particularly that of the South-west. Over 2,000 species of vascular plants are listed because they are either poorly known or are possibly restricted to a small geographic area. Over 1,500 fall into the former category because there are insufficient data on their distribution or taxonomic identity to make judgements on their rarity. Because so many species are listed as poorly known it is not suggested that a high proportion of these are rare or restricted in distribution.

All of the 124 presumed rare species listed here occur in the South-west Botanical Province. This figure probably represents only one quarter of the species of the province which will eventually be placed in this category when data become available. If this assumption is correct then approximately 10% of the south-western flora could eventually be classified as rare. This figure is similar to that quoted for the flora of the United States of America (Ayensu and De Filippis 1978) and Australia as a whole (Hartley and Leigh 1979). However the figure predicted here for the South-west Province is based only on current information. It is likely that with more taxonomic revisionary studies of local genera, 25-30% of the south-western flora will be classified as rare.

The list presented here can only be regarded as a starting point. This publication is intended to present the facts based on the only reliable data source available, the specimens in the Western Australian Herbarium. There are numerous omissions and errors especially in the use of obsolete names and the recording of species which have probably never been collected in this State. These errors only reflect the state of knowledge of the flora.

By giving distribution data, this publication may seem to inadvertently encourage over-exploitation of some horticulturally desirable, rare or potentially rare plants. The localities given for species likely to be in this category are only approximations and refer to a region up to 50 km radius around the towns or localities cited.

It is fervently hoped that every species of plant will soon be adequately protected by law, throughout the whole State, especially those listed here as rare or restricted and those which may be listed at a future date.

ACKNOWLEDGEMENTS

The authors are grateful to the Western Australian Wildlife Authority providing financial assistance for collecting data. Anne Coates extracted some of the information from herbarium labels, Mrs. J. Goff provided much assistance and preliminary checking of data and Denise Marchant typed and re-typed the manuscript as well as helped with the final checking and indexing.

HISTORICAL PERSPECTIVE

Specht et al. (1974) listed species which were considered rare and, or, endangered for each State including Western Australia. The list for this State was based on readily available data at the time, mainly relying on personal observations because there was not time to check herbarium records. The Western Australian list included 41 rare species, 42 endangered, 19 depleted and 5 species regarded as probably extinct. No attempt will be made to comment on discrepancies between the list of Specht et al. and that presented here. The current listing has been able to utilise recent information and should be regarded as replacing the earlier one.

The present authors began collecting information on the distribution of Western Australian plant species in 1976. Initially, it was intended to list all species with less than 10 locality records as poorly collected. When it was realised that this would entail the listing of half of all recorded species, the critical number of collections was reduced to less than 5. By December 1978 all of the 200,000 specimens in the herbarium had been examined and a data sheet made out for each species. The northernmost, southernmost, easternmost and westernmost localities were recorded for each, along with a record of the number of collections and a note on heterogeneity within a species folder.

In 1978 a request for a list of Western Australian plants considered as rare, was received by the authors from CONCOM (the Council of Nature Conservation Ministers). A list of rare species and their conservation status was provided and included in 'Plants at Risk in Australia' (Hartley and Leigh 1979). Discussions were held with the compilers of this Australia-wide list so that there would be agreement between the categories used for the Australian list and that presented here. In 'Plants at Risk in Australia', 2,053 species are listed as actually or potentially at risk. This represents approximately 10% of the Australian flora. Of this total, 45% are from Western Australia, most of these being from the South-west.

SOURCE OF THE DATA

The list was derived from details on specimen labels in the Western Australian Herbarium (PERTH) as at December 1978, supplemented by data on distribution of *Thysanotus* (Liliaceae) obtained from the herbarium of the Botany Department, University of Western Australia (UWA). In the absence of specimens of species thought to occur in Western Australia, an approximate locality was obtained from the type Specimen or from the original description.

The entries were not compared with any check list of the Northern Territory or South Australia because it was felt that this would lead to results which could be misinterpreted. Western Australian knowledge of the flora of the Kimberley region is regarded by the present authors as having been gained in isolation. Many of the Kimberley species recorded here are most probably conspecific with Northern Territory species yet they have different names. The same applies to a lesser extent to species recorded in the Western Australian Eremaea. It should be noted however that all of the species here considered as rare and almost all considered to be restricted are in the South-west Botanical Province.

Subspecies were not listed owing to inconsistencies in the filing of specimens in the herbarium. This is regrettable since subspecies are usually geographically restricted and many may be quite rare.

Taxonomic decisions were avoided. Where an epithet which appeared on an empty herbarium folder is regarded as a synonym in Bentham, 'Flora Australiensis' (1863-1878), the species was not listed. If there was Western Australian material in the herbarium and the species name used on that folder was considered by Bentham to be a synonym, then the herbarium name was retained. Recent taxonomic revisions dealing with western species of the following taxa were consulted:- Chloanthaceae, Cyperaceae, Haloragaceae, Tremandraceae, Adenanthos, Andersonia and Frankenia. Any recently described plants, published and available in Perth to January 1979, are also included.

Many genera of Western Australian plants were currently being revised and specimens were on loan from the herbarium. The largest such genera unavailable for inclusion were *Grevillea* (Proteaceae) and *Daviesia* (Papilionaceae). When revisions of these genera are published many species will no doubt be able to be categorised as rare or restricted. Other genera currently being revised are marked in the list by an asterisk and footnote.

INTERPRETATION OF CODING

Because there is a lack of information for so many species listed here, internationally established categories for classifying rare species could not be adopted. Categories such as 'Endangered', 'Threatened', 'Vulnerable', 'Depleted' or 'Presumed Extinct' all require detailed knowledge. When sufficient information has been collected it will be possible to assign Western Australian species into categories adopted by the International Union for Conservation of Nature and National Resources, known as the Red Data categories (Melville 1970, Lucas and Synge 1978) or those used by the compilers of 'Endangered and Threatened Plants of the United States', (Ayensu and De Philipps 1978).

The categories adopted here are summarised on page 7.

- A. Includes those species not having any Western Australian collected material. Because original descriptions of many plant species were not readily available in local libraries it is likely that some species listed as 'A' are not Western Australian.

B. The most significant category used. Species listed here are apparently rare and have a quite restricted distribution, being known only from a small geographic area or from small populations in a specific, rare habitat. These have been listed separately in Appendix I.

C. Species in the Western Australian Herbarium represented only by a Type Specimen. No other collection is known in the herbarium.

'A' and 'C' are similar categories. They were kept separate because the species listed under 'C' could be verified as Western Australian species.

D. Assigned to poorly known species on the basis of having less than five herbarium collections. A considerable proportion of the total is in this category. Rarity is not implied. This classification is not equivalent to the category 'Indeterminate' used by Melville (1970) because it is likely that many of the entries are widespread, although it is probable that a number will prove to be rare or restricted when more data are available.

Some of the species listed as 'D' are horticulturally desirable and require detailed information on distribution and population size. These species are listed separately in Appendix 2.

E. Species which have a restricted distribution. Herbarium records show that these are only known to occur between localities less than 100 km apart. Clearly, many of the species listed in this category are likely to be rare. Although most of the herbarium records used in this survey are less than 20 years old, it is likely that species no longer occur in extreme localities. This is particularly significant in the case of species occurring in the expanding agricultural districts of the South-west.

F. A geographically wider classification, listing those species regarded as partially or more or less restricted. These are known only to occur between localities less than 160 km apart. Many are probably quite widespread and common. However, because of insufficient data some species with an apparent wide distribution may be quite rare. Apart from the effects of extensive recent clearing of vegetation, some species are likely to be restricted to specific habitats which may be some distance apart. Horticulturally desirable species in this category and category 'E' are listed in Appendix 2.

RESULTS OF THE SURVEY AND CONCLUSIONS

A numerical presentation of the results is as follows:-

	Kimberley	Eremaea	South-west	Widespread or locality unknown	TOTAL
A (No specimens)	17	18	51	175	261
B (Rare)	0	0	124	0	124
C (Type Specimen only)	22	6	31	13	72
D (Poorly collected, less than five collections)	415	221	544	31	1,211
E (Restricted within 100 km)	1	14	181	2	198
F (Restricted within 160 km)	0	4	151	1	156
TOTAL	455	263	1,082	222	2,022

Conclusions:-

- (i) The total number of species considered as rare is 124. All of these are south-western species. They are listed separately in Appendix I.
- (ii) Data are insufficient to enable recognition of any rare vascular plant in the Kimberley or Eremaean Botanical Provinces.

- (iii) Approximately 8% (305 species from 'B' and 'E') of the South-western flora is considered rare or restricted.
- (iv) Approximately 17% (626 species, totalled from 'A', 'C' and 'D') of the species recorded for the South-west Botanical Province are poorly known.
- (v) Because the survey was based solely on herbarium material, there is no evidence that any species has become extinct. Such a possibility can only be proven after field searches.

PROGRESS AND THE FUTURE

This list can only be considered as a first attempt to record Western Australian species considered to be poorly collected and those species for which there is some evidence of rarity.

The authors intend to regularly revise the listings. Data on the exact location of rare species, including information on size of population, habitat and conservation status are being collected and kept in files at the Western Australian Herbarium. Information on each rare species will eventually be published in the same way as has been done in the Red Data Books.

The authors would welcome sightings of rare and restricted species listed if a range extension can be added or a species can no longer be found in a previously recorded locality. Specimens should not be collected; a photograph with detailed notes is all that is required. Notes on habitat would be particularly welcome.

KEY TO CODING AND ABBREVIATIONS

Explanatory notes on the letter code are given on pages 3 and 4.

CATEGORY A. No specimen in the Western Australian Herbarium.

CATEGORY B. Rare.

CATEGORY C. Represented in the Western Australian Herbarium only by the Type Specimen.

CATEGORY D. Poorly collected. Less than 5 collections in the Western Australian Herbarium.

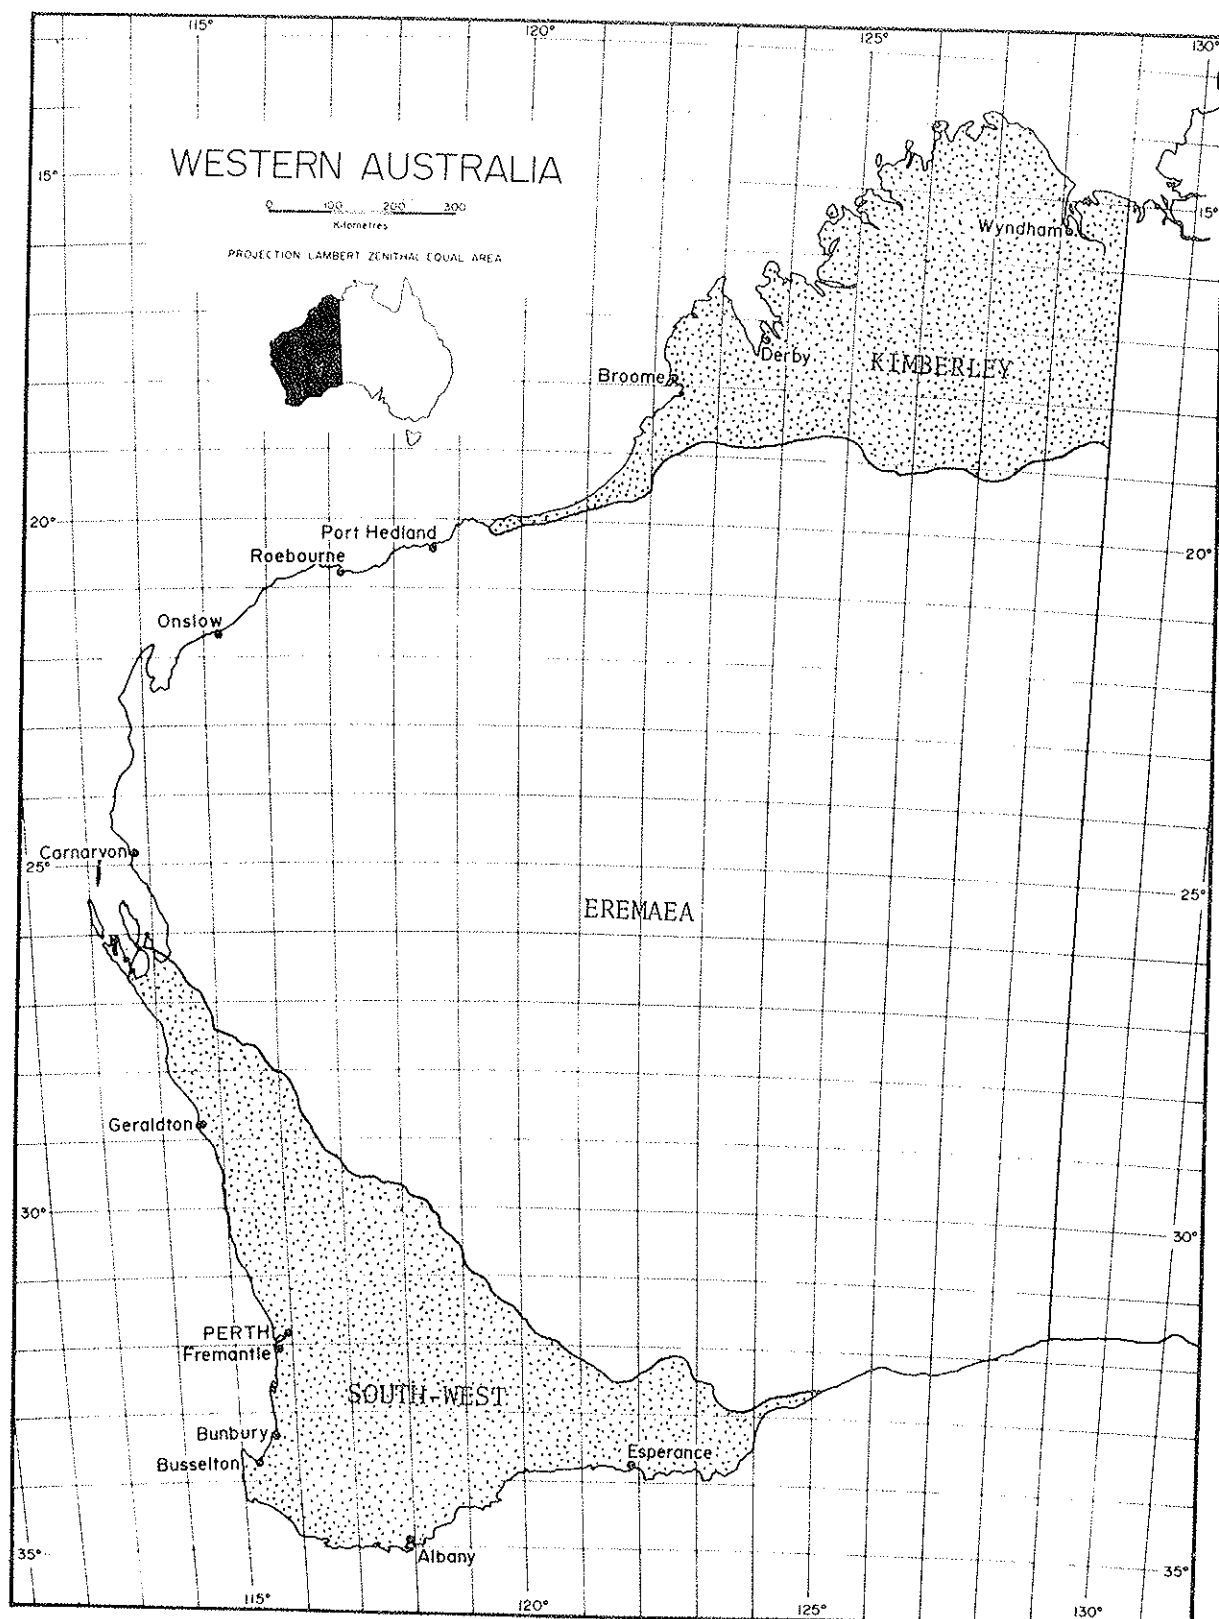

CATEGORY E. Restricted to localities less than 100 km apart.

CATEGORY F. Restricted to localities less than 160 km apart.

Locality abbreviations:-

Arch.	Archipelago
Ck.	Creek
E.	east
Is.	Island
ms.	manuscript name
Mt.	Mount
N.	north
Nat. Pk.	National Park
N.W.	north west
Pt.	Point
Ra.	Range
Res.	Reserve
Riv.	River
S.	south
Stn.	Station (property)
W.	west

In the number of specimens listed in the tables, 20 should be regarded as equal to or greater than 20.

MAP I The boundaries of the Kimberley, Eremaean and South-western Botanical Provinces. After Beard (1979) except for the Northern Botanical Province which is here regarded as Kimberley

APPENDIX I

LIST OF SPECIES CONSIDERED TO BE RARE

PTERIDOPHYTA

Asplenium marinum L.

MONOCOTYLEDONS

Anigozanthos gabriellae Domin
Anigozanthos preissii Endl.
Restio stenostachyus W.V.Fitzg.
Rhizanthella gardneri R.S. Rogers
Stawellia dimorphantha F.Muell.

DICOTYLEDONS

Acacia aciphylla Benth.
Acacia anomala C.A.Gardner ex A.B.Court
Acacia aphylla Maslin
Acacia cochlocarpa Meisn.
Acacia horridula Meisn.
Acacia inops Maiden et Blakely
Acacia luteola Maslin
Acacia megacephala Maslin
Acacia merrickae Maiden et Blakely
Acacia oldfieldii F.Muell.
Acacia oxyclada F.Muell. ex Benth.
Acacia retrorsa Meisn.
Acacia sedifolia Maiden et Blakely
Acacia subracemosa Maslin
Acacia yorkrakinensis C.A.Gardner
Adenanthos detmoldii F.Muell.
Adenanthos ellipticus A.S.George
Andersonia axilliflora (Stschegl.) Druce
Andersonia grandiflora Stschegl.
Banksia brownii Baxter ex R.Br.
Banksia cuneata A.S.George
Banksia goodii R.Br.
Banksia lanata A.S.George ms.
Banksia laricina C.A.Gardner
Banksia praemorsa C.R.P. Andr.
Banksia rubicunda A.S.George ms.
Banksia scabrella A.S.George
Banksia solandri R.Br.
Banksia tricuspis Meisn.
Banksia verticillata R.Br.
Boronia crassipes Benth.
Boronia tenuis (Lindl.) Benth.
Bossiaea disticha Lindl.
Bossiaea webbia F.Muell.
Brachysema subcordatum Benth.
Calytrix superba C.A.Gardner et A.S.George
Casuarina fibrosa C.A.Gardner
Cephalotus follicularis Labill.
Conospermum densiflorum Lindl.

APPENDIX I Cont.,

DICOTYLEDONS Cont.,

Conospermum dorrienii Domin
Darwinia acerosa W.V.Fitzg.
Darwinia carnea C.A.Gardner
Darwinia collina C.A.Gardner
Darwinia leiostyla (Turcz.) Domin
Darwinia macrostegia (Turcz.) Benth.
Darwinia masoni C.A.Gardner
Darwinia meeboldii C.A.Gardner
Darwinia rhadinophylla F.Muell.
Darwinia squarrosa (Turcz.) Domin
Dicrastylis linearifolia Munir
Dodonaea hackettiana W.V.Fitzg.
Drosera occidentalis A.Morrison
Dryandra comosa Meisn.
Dryandra cynaroides C.A.Gardner
Dryandra preissii Meisn.
Eremaea acutifolia F.Muell.
Eremaea purpurea C.A.Gardner
Eremophila dicroantha Diels
Eucalyptus aquilina Brooker
Eucalyptus brachyphylla C.A.Gardner
Eucalyptus brevistylis Brooker
Eucalyptus burdettiana Blakely et Steedman
Eucalyptus calcicola Brooker
Eucalyptus carnabyi Blakely et Steedman
Eucalyptus coronata C.A.Gardner
Eucalyptus desmondensis Maiden et Blakely
Eucalyptus ficifolia F.Muell.
Eucalyptus guilfoylei Maiden
Eucalyptus insularis Brooker
Eucalyptus jacksonii Maiden
Eucalyptus megacornuta C.A.Gardner
Eucalyptus pendens Brooker
Eucalyptus sepulcralis F.Muell.
Exocarpos odoratus (Miq.) DC.
Franklandia triaristata Benth.
Hakea cristata R.Br.
Hakea megalosperma Meisn.
Hakea neurophylla Meisn.
Halgania corymbosa Lindl.
Hibbertia bracteosa Turcz.
Hibbertia miniata C.A.Gardner
Hybanthus volubilis E.M.Bennett
Isopogon alpicornis Diels
Isopogon axillaris R.Br.
Jacksonia carduacea Meisn.
Jacksonia eremodendron E.Pritzel
Jansonia pimelioides (Meisn.) C.A.Gardner
Kennedia beckeriana F.Muell.
Kennedia macrophylla (Meisn.) Benth.
Lasiopetalum bracteatum (Endl.) Benth.
Lechenaultia longiloba F.Muell.
Lechenaultia pulvinaris C.A.Gardner
Lechenaultia superba F.Muell.
Leucopogon amplexans Ostenf.

APPENDIX I Cont.,

DICOTYLEDONS Cont.,

Leucopogon mollis E. Pritzel
Lyonsia diaphanophlebia (F.Muell.) Benth.
Melaleuca baxteri Benth.
Oxylobium racemosum (Turcz.) C.A.Gardner
Pimelea physodes Hook.
Pultenaea skinneri F.Muell.
Regelia velutina Benth.
Roycea pycnophylloides C.A.Gardner
Siegfrieda darwinioides C.A.Gardner
Spirogardnera rubescens Stauffer
Stylidium albomontis Carlquist
Stylidium galioides C.A.Gardner
Synaphaea acutiloba Meisn.
Synaphaea brachystachya Lindl.
Synaphaea pinnata Lindl.
Tetratheca nuda Lindl.
Tetratheca parvifolia J.Thompson
Thomasia discolor Steud.
Thomasia gardneri S.Paust
Thomasia glutinosa Lindl.
Thomasia montana Steud.
Thomasia solanacea (Sims.) J. Gay
Urocarpus grandiflorus (Hook.) P.G.Wils.
Villarsia calthifolia F.Muell.

APPENDIX 2

EXPLOITED AND WIDESPREAD SPECIES NOT INCLUDED IN THE MAJOR LIST
OR SPECIES LISTED AS 'D', 'E' OR 'F' WHICH ARE IN NEED OF ASSESSMENT
AND MONITORING

Balaustion microphyllum C.A.Gardner
Banksia lullfitzii C.A.Gardner
Banksia pilostylis C.A.Gardner
Boronia revoluta P.G.Wils.
Conospermum scaposum Benth.
Daviesia epiphylla Meisn.
Dryandra polycephala Benth.
Dryandra pulchella Meisn.
Eriostemon nutans P.G.Wils.
Eucalyptus steedmannii C.A.Gardner
Hakea victoria Meisn.
Hemiandra gardneri O.H.Sargent
Hibbertia lasiopus Benth.
Hibbertia sargentii S.Moore
Isopogon latifolius R.Br.
Kennedia glabrata (Benth.) Lindl.
Lachnostachys albicans Hook.
Lambertia echinata R.Br.
Lambertia orbifolia C.A.Gardner
Lysinema elegans Sonder
Newcastelia chrysophylla C.A.Gardner
Nigromnia globosa Carolin
Pomaderris intangenda F.Muell.
Regelia cymbifolia (J.C.Schau.) C.A.Gardner
Selenothamnus helmsii (F. Muell. et Tate) Melville
Stylidium utricularioides Benth.
Templetonia drummondii Benth.
Verticordia staminosa C.A.Gardner et A.S.George
Villarsia lasiosperma F.Muell.
Villarsia submersa Aston
