Figure A2. 1: Physiographic Subdivisions of the Pilbara Region (modified after Beard, 1975)

Figure A2. 2: Major Geological Subdivisions of the Pilbara Region

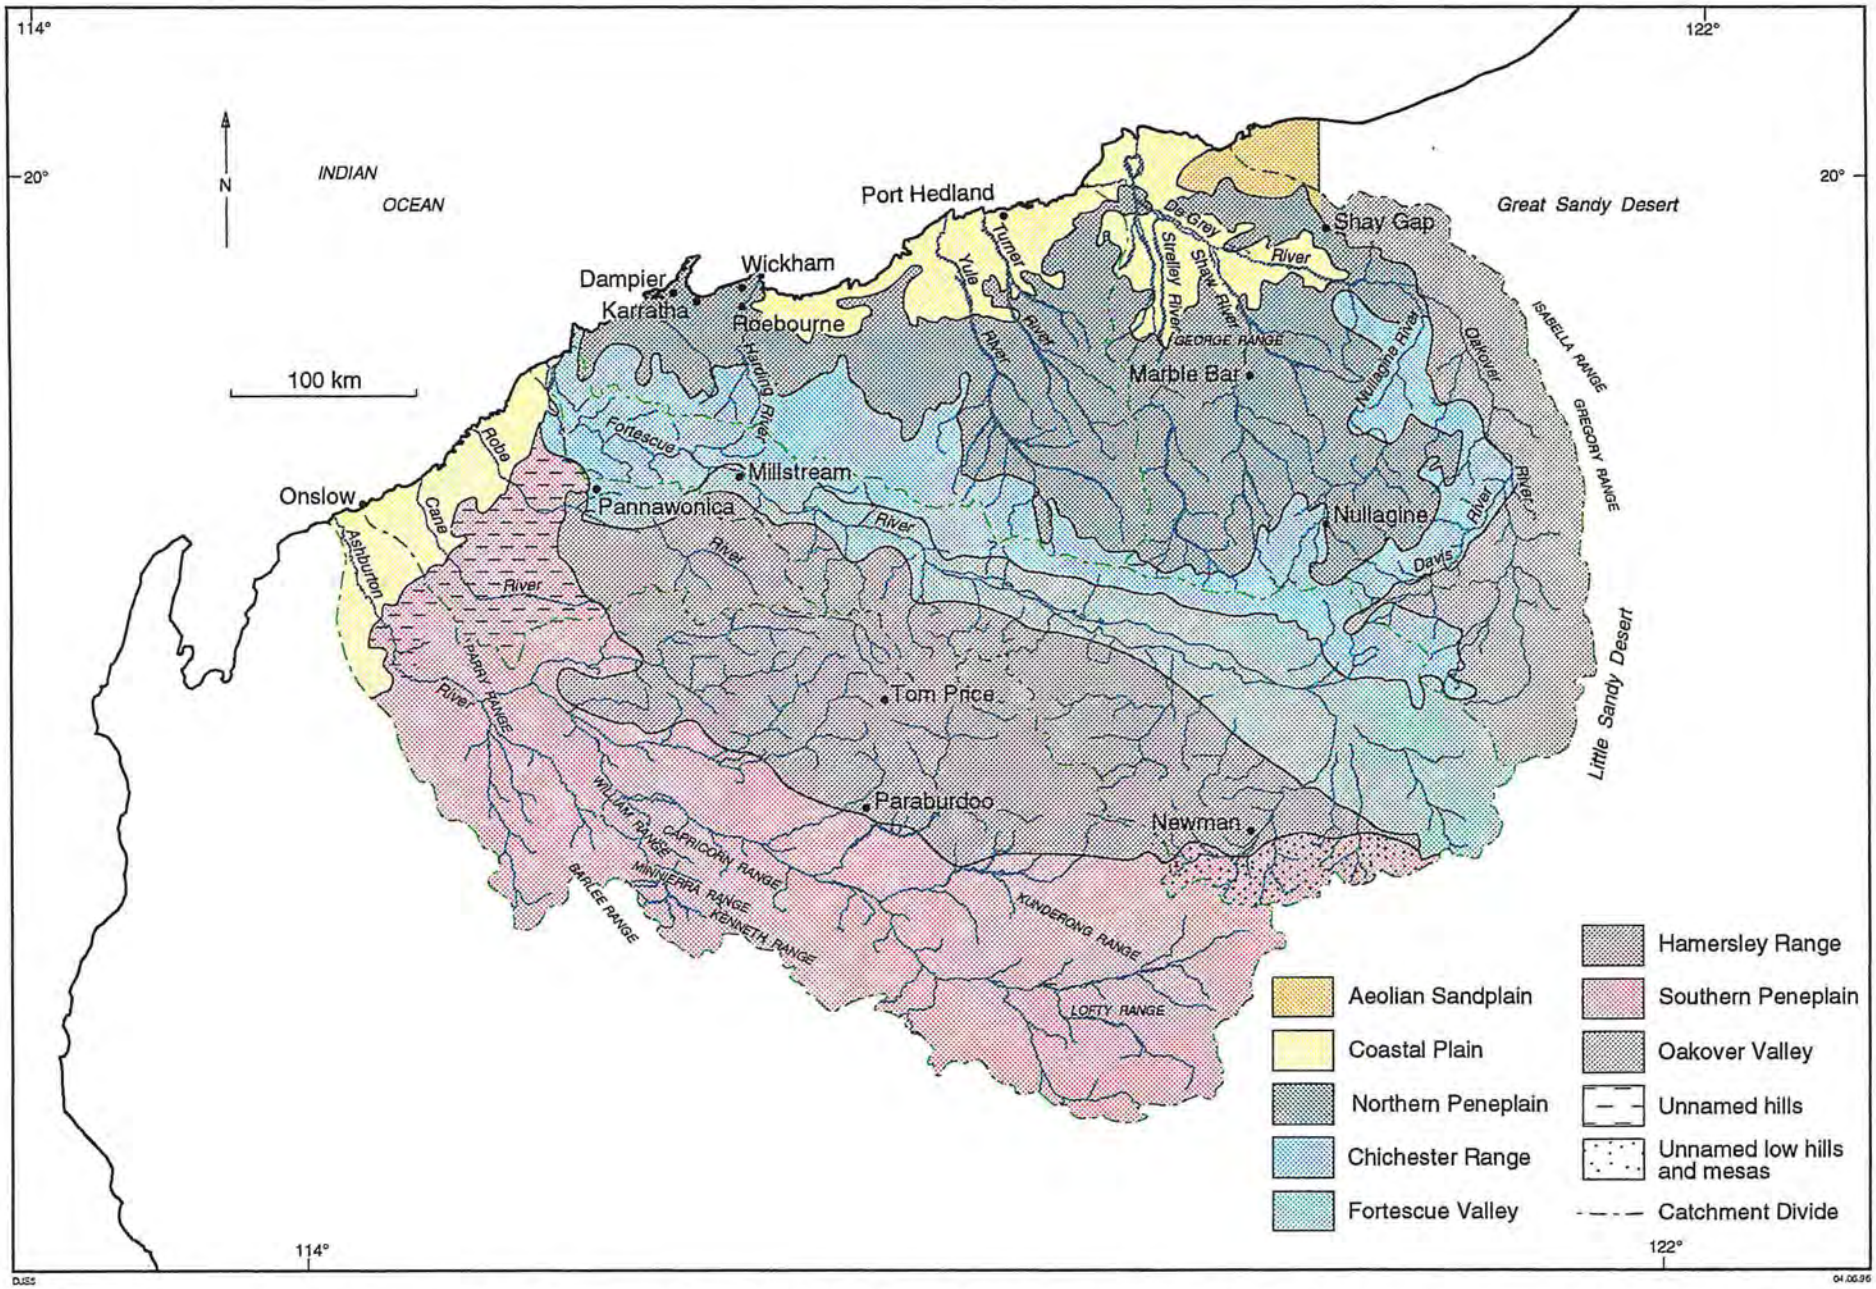

Figure A2.1:(source: Skidmore,1996) Physiographic Subdivisions at the Pilbara Region (modified after Beard, 1975).

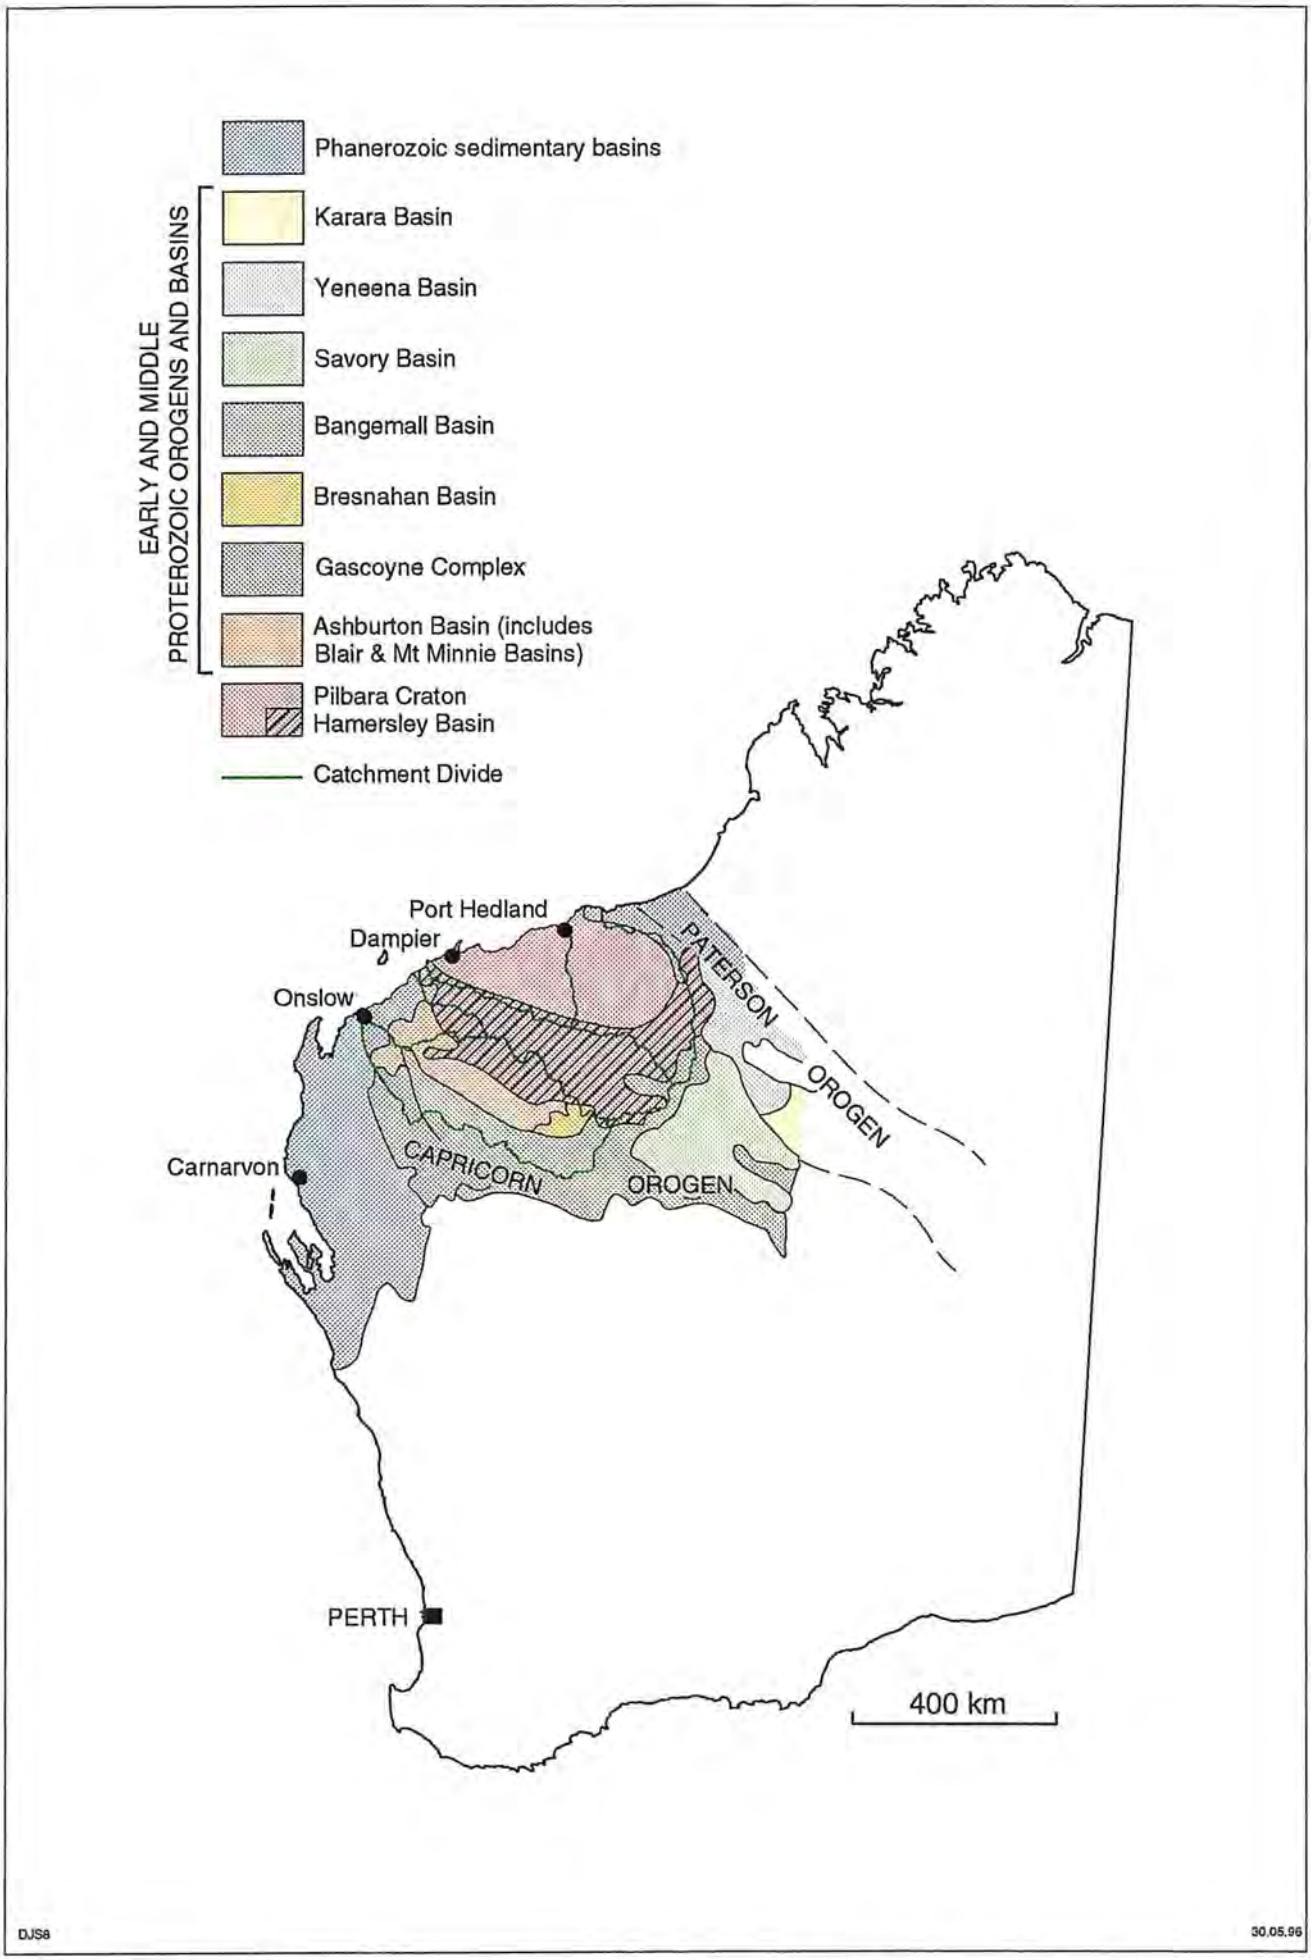

Figure A2.2:(source: Skidmore,1996)
Major geological subdivisions of the Pilbara Region

Appendix 3: Surface Water Resources

Surface Water Source: Ashburton River

River Basin: Ashburton **AWRC Basin No: 706**

Location: DS340 (Capricorn Range)
7 423 200 m N, 478 600 m E

Catchment Details:

Area:	41400 km^2
Average rainfall:	375 mm/annum
Pan evaporation:	3400 - 3700 mm/annum
Alienated:	50%
Cleared:	No significant clearing.
Land use:	50% vacant Crown land and Reserves, 50% sheep and cattle grazing on pastoral leases.

Mean Annual Flow (GL/year):	320
Estimated Divertible Yield (GL/year):	37

Water Quality:

Salinity:	Fresh.
Other significant parameters:	Turbidity high in high flow events.

Existing Developments:

WC:	None.
Other:	None.
Current uses:	None.

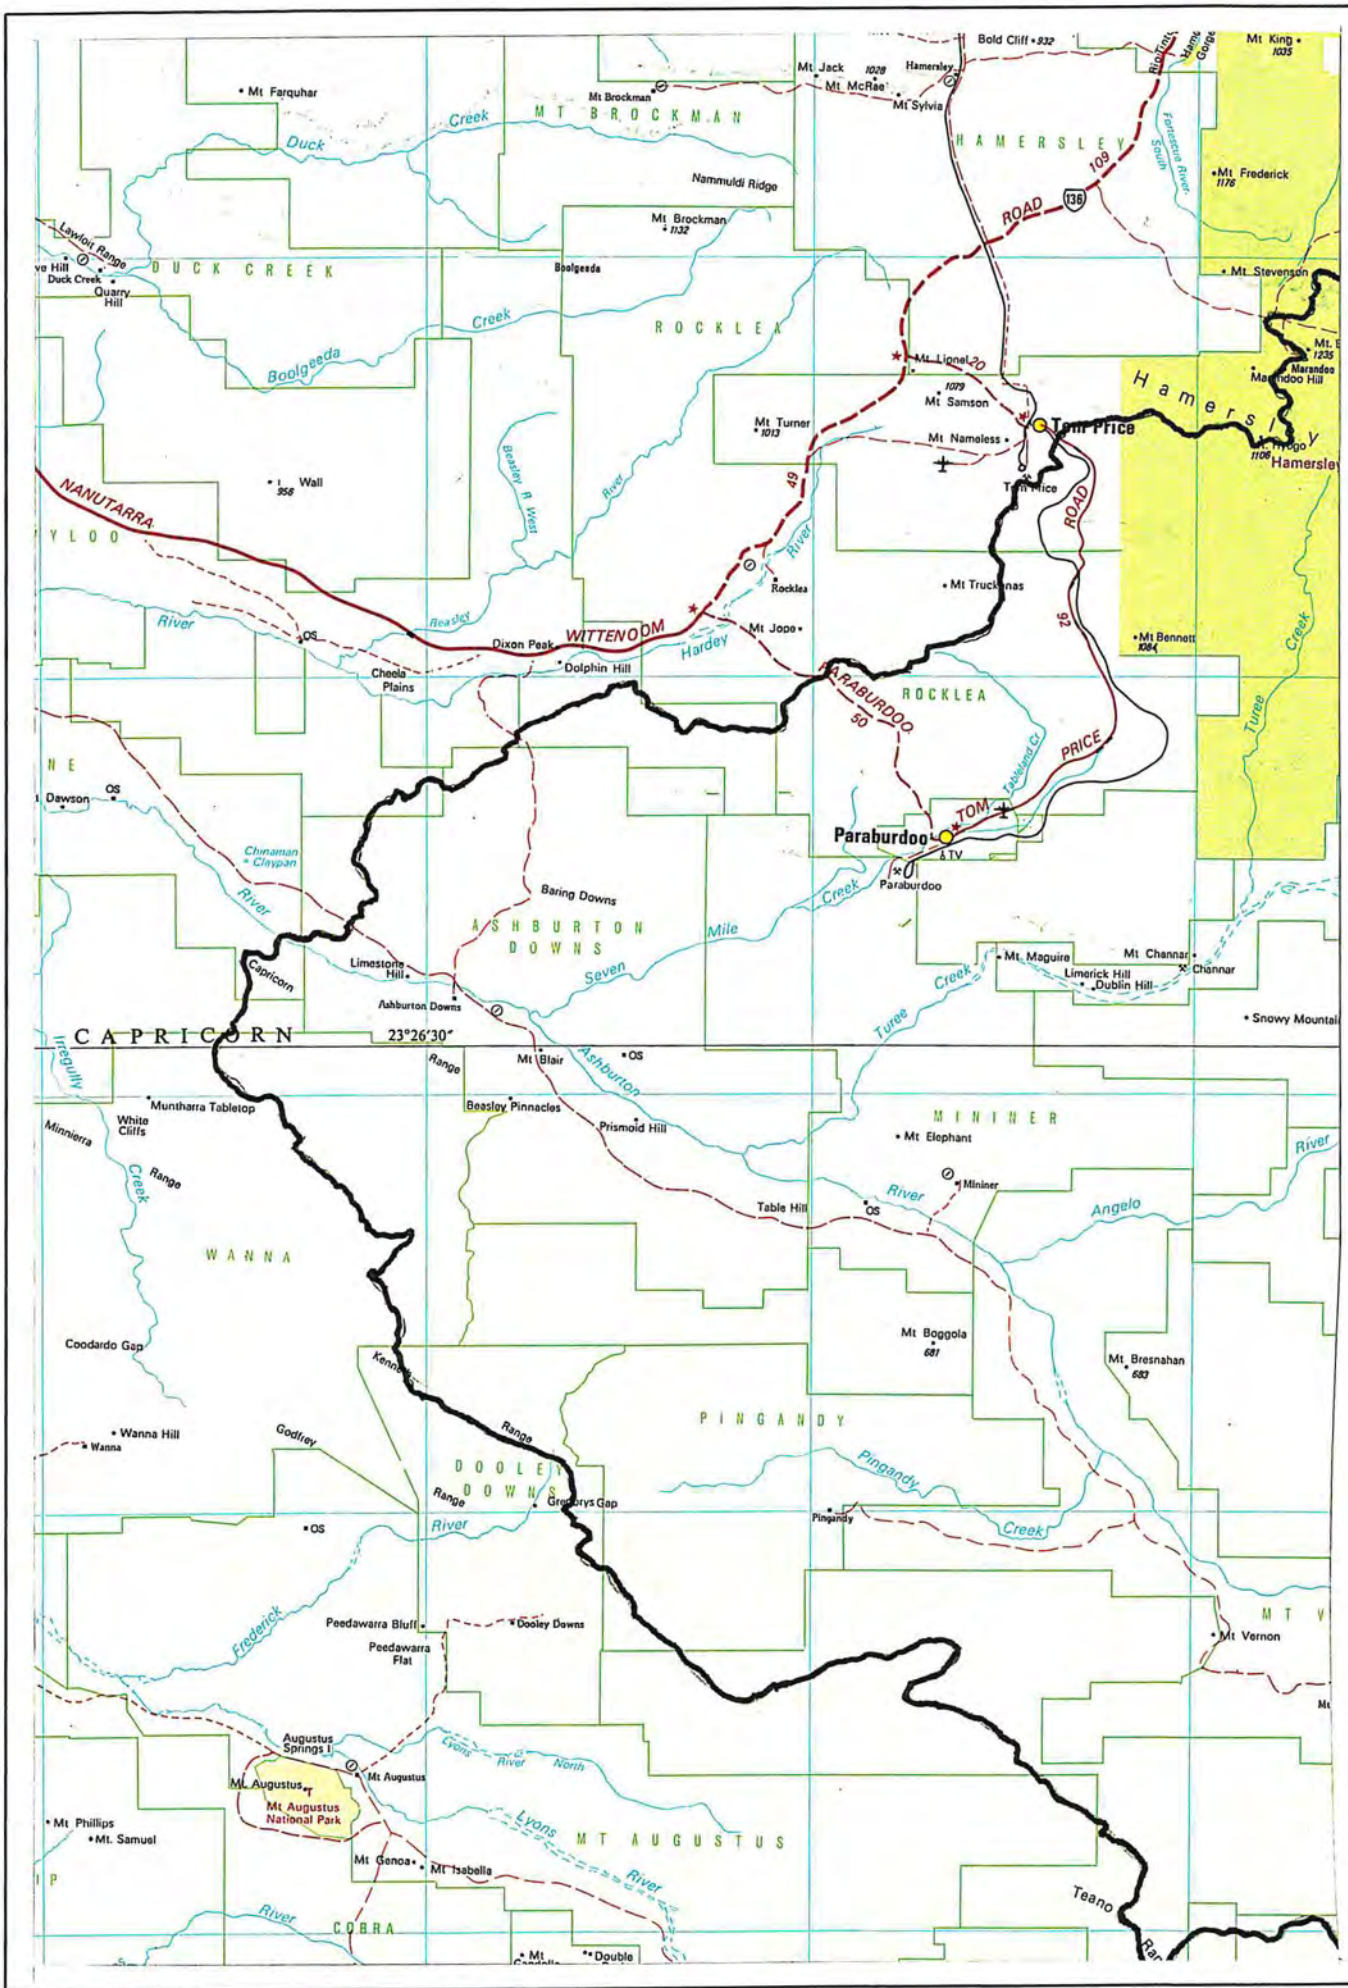
Possible future uses:

Possible water supply for West Pilbara development. The potential yield is based on a single reservoir. Additional yield may be available if this site is used conjunctively with a groundwater source.

Factors (environmental, social and economic) which may affect future development:

Comments:

The reliability of estimated divertible flow is fair. Treatment for turbidity may be required.



Ashburton River

Surface Water Source: Robe River

River Basin: Onslow Coast **AWRC Basin No: 707**

Location: DS124
7 594 500 m N, 456 000 m E

Catchment Details:

Area:	3000 km^2
Average rainfall:	330 mm/annum
Pan evaporation:	3400 mm/annum
Alienated:	40%
Cleared:	No significant clearing, but some overgrazing along river frontage.
Land use:	60% vacant Crown land in ranges, 40% sheep and cattle on pastoral leases, some open cut ore mining.

Mean Annual Flow (GL/year): 27
Estimated Divertible Yield (GL/year): 4

Water Quality:

Salinity:	Fresh.
Other significant parameters:	Turbidity high in high flow events.

Existing Developments:

WC:	None.
Other:	None.
Current uses:	None.

Possible future uses:

Possible water supply for West Pilbara development.

Factors (environmental, social and economic) which may affect future development:

1. Aboriginals in the past have indicated they would not object to a dam being constructed.
2. Loss of extensive area of River Gum forest and woodland associated shrublands of the valley floor. Similar areas upstream and downstream of the reservoir would remain.
3. Loss of temporary pools in the reservoir area and reduction in flooding causing further reduction of temporary aquatic habitats downstream of the dam. However, these habitats, being temporary, do not have the biological value of pools on the Harding, Sherlock or Fortescue Rivers.

Comments:
The reliability of data for estimated divertible flows is poor. Treatment for turbidity may be required.

Robe River

Surface Water Source:	Robe River

River Basin: Onslow Coast **AWRC Basin No: 707**

Location: DS154
7 577 000 m N, 474 300 m E

Catchment Details:

Area:	1970 km^2
Average rainfall:	330 mm/annum
Pan evaporation:	3400 mm/annum
Alienated:	60%
Cleared:	No significant clearing, but some overgrazing along river frontage.
Land use:	40% vacant Crown land in ranges, 60% sheep and cattle on pastoral leases.

Mean Annual Flow (GL/year): 18
Estimated Divertible Yield (GL/year): 9

Water Quality:

Salinity:
Other significant parameters:

Existing Developments:

WC:
Other:
Current uses:

Possible future uses:

Possible water supply for West Pilbara development.

Factors (environmental, social and economic) which may affect future development:

The Robe River Catchment is the subject of extensive mining claims and these have a profound impact on the development of water resources.

Comments:

The reliability of data for the mean annual flow and estimated divertible flow is poor.

Robe River

Surface Water Source: Kumina Creek

River Basin: Onslow Coast **AWRC Basin No: 707**

Location: DS20
7 588 200 m N, 482 300 m E

Catchment Details:

Area:	506 km^2
Average rainfall:	330 mm/annum
Pan evaporation:	3400 mm/annum
Alienated:	60%
Cleared:	No significant clearing, but some overgrazing along river frontage.
Land use:	40% vacant Crown land in ranges, 60% sheep and cattle on pastoral leases.

Mean Annual Flow (GL/year): 2.5
Estimated Divertible Yield (GL/year): 0

Water Quality:

Salinity:
Other significant parameters:

Existing Developments:

WC:
Other:
Current uses:

Possible future uses:

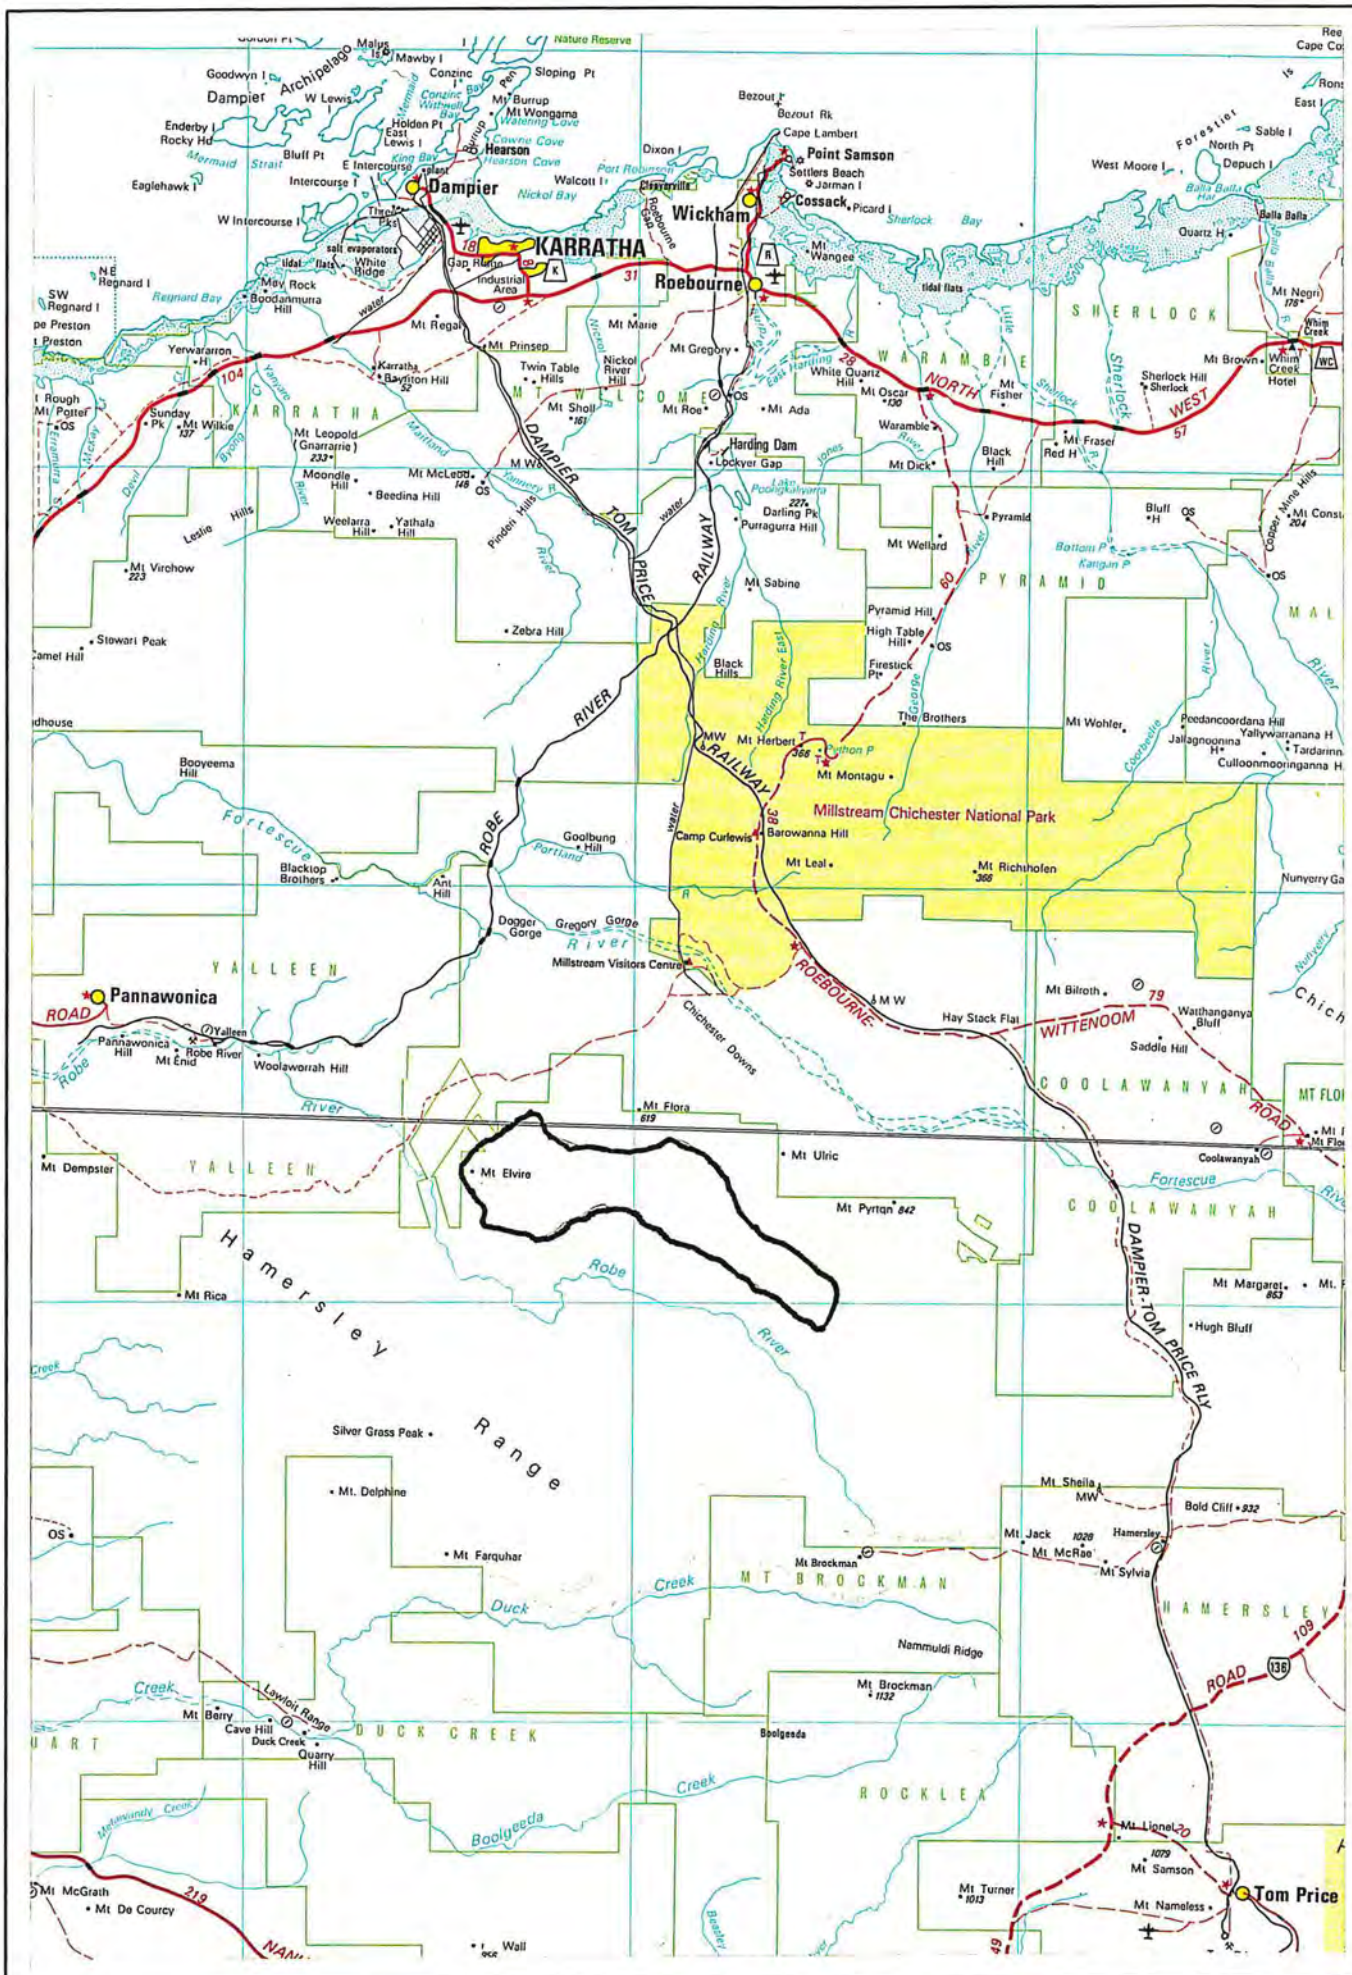
Possible water supply for West Pilbara development.

Factors (environmental, social and economic) which may affect future development:

The base of the Hamersley Ranges, between Kumina Creek and Robe River, is the subject of a State Agreement mining tenement associated with the Robe River Mining operation.

Comments:

The reliability of data for estimated divertible flows is poor.



Kumina Creek

Surface Water Source:	Cane River

River Basin: Onslow Coast **AWRC Basin No: 707**

Location: DS74
7 559 000 m N, 358 000 m E

Catchment Details:

Area:	2290 km^2
Average rainfall:	330 mm/annum
Pan evaporation:	3400 mm/annum
Alienated:	
Cleared:	
Land use:	

Mean Annual Flow (GL/year):	62
Estimated Divertible Yield (GL/year):	6

Water Quality:

Salinity:	150 mg/L TSS.
Other significant parameters:	Turbidity high in high flow events.

Existing Developments:

WC:	None.
Other:	None.
Current uses:	None.

Possible future uses:

Conjunctive use by artificial recharge with a groundwater resource may be a possibility, but no firm options have been identified, even though the coastal areas have been indicated as being prospective for groundwater developments.

Factors (environmental, social and economic) which may affect future development:

Comments:

The reliability of data on the mean annual flow and estimated divertible flow is fair. Treatment for turbidity may be required. Surface source will need to be developed taking into account the impact on the groundwater source.

Cane River

Surface Water Source: Cane River

River Basin: Onslow Coast **AWRC Basin No: 707**

Location: DS114
7 546 000 m N, 389 000 m E

Catchment Details:

Area:	817 km^2
Average rainfall:	330 mm/annum
Pan evaporation:	3400 mm/annum
Alienated:	
Cleared:	
Land use:	

Mean Annual Flow (GL/year):	18
Estimated Divertible Yield (GL/year):	3

Water Quality:

Salinity:	150 mg/L TSS.
Other significant parameters:	Turbidity high in high flow events.

Existing Developments:

WC:	None.
Other:	None.
Current uses:	None.

Possible future uses:

Conjunctive use by artificial recharge with a groundwater resource may be a possibility, but no firm options have been identified, even though the coastal areas have been indicated as being prospective for groundwater developments.

Factors (environmental, social and economic) which may affect future development:

Comments:

The reliability of data on the mean annual flow and estimated divertible flow is fair. Treatment for turbidity may be required. Surface source will need to be developed taking into account the impact on the groundwater source.

Cane River

Surface Water Source:	Fortescue River

River Basin: Fortescue **AWRC Basin No: 708**

Location: Opthalmia Dam

Catchment Details:

Area:	4200 km^2
Average rainfall:	300 mm/annum
Pan evaporation:	3600 mm/annum
Alienated:	50%
Cleared:	No significant clearing, some overgrazing along river frontages.
Land use:	About 50% vacant Crown Land, 50% cattle and sheep grazing on pastoral leases, some open cut ore mining.

Mean Annual Flow (GL/year):	31
Estimated Divertible Yield (GL/year):	10

Water Quality:

Salinity:
Other significant parameters:

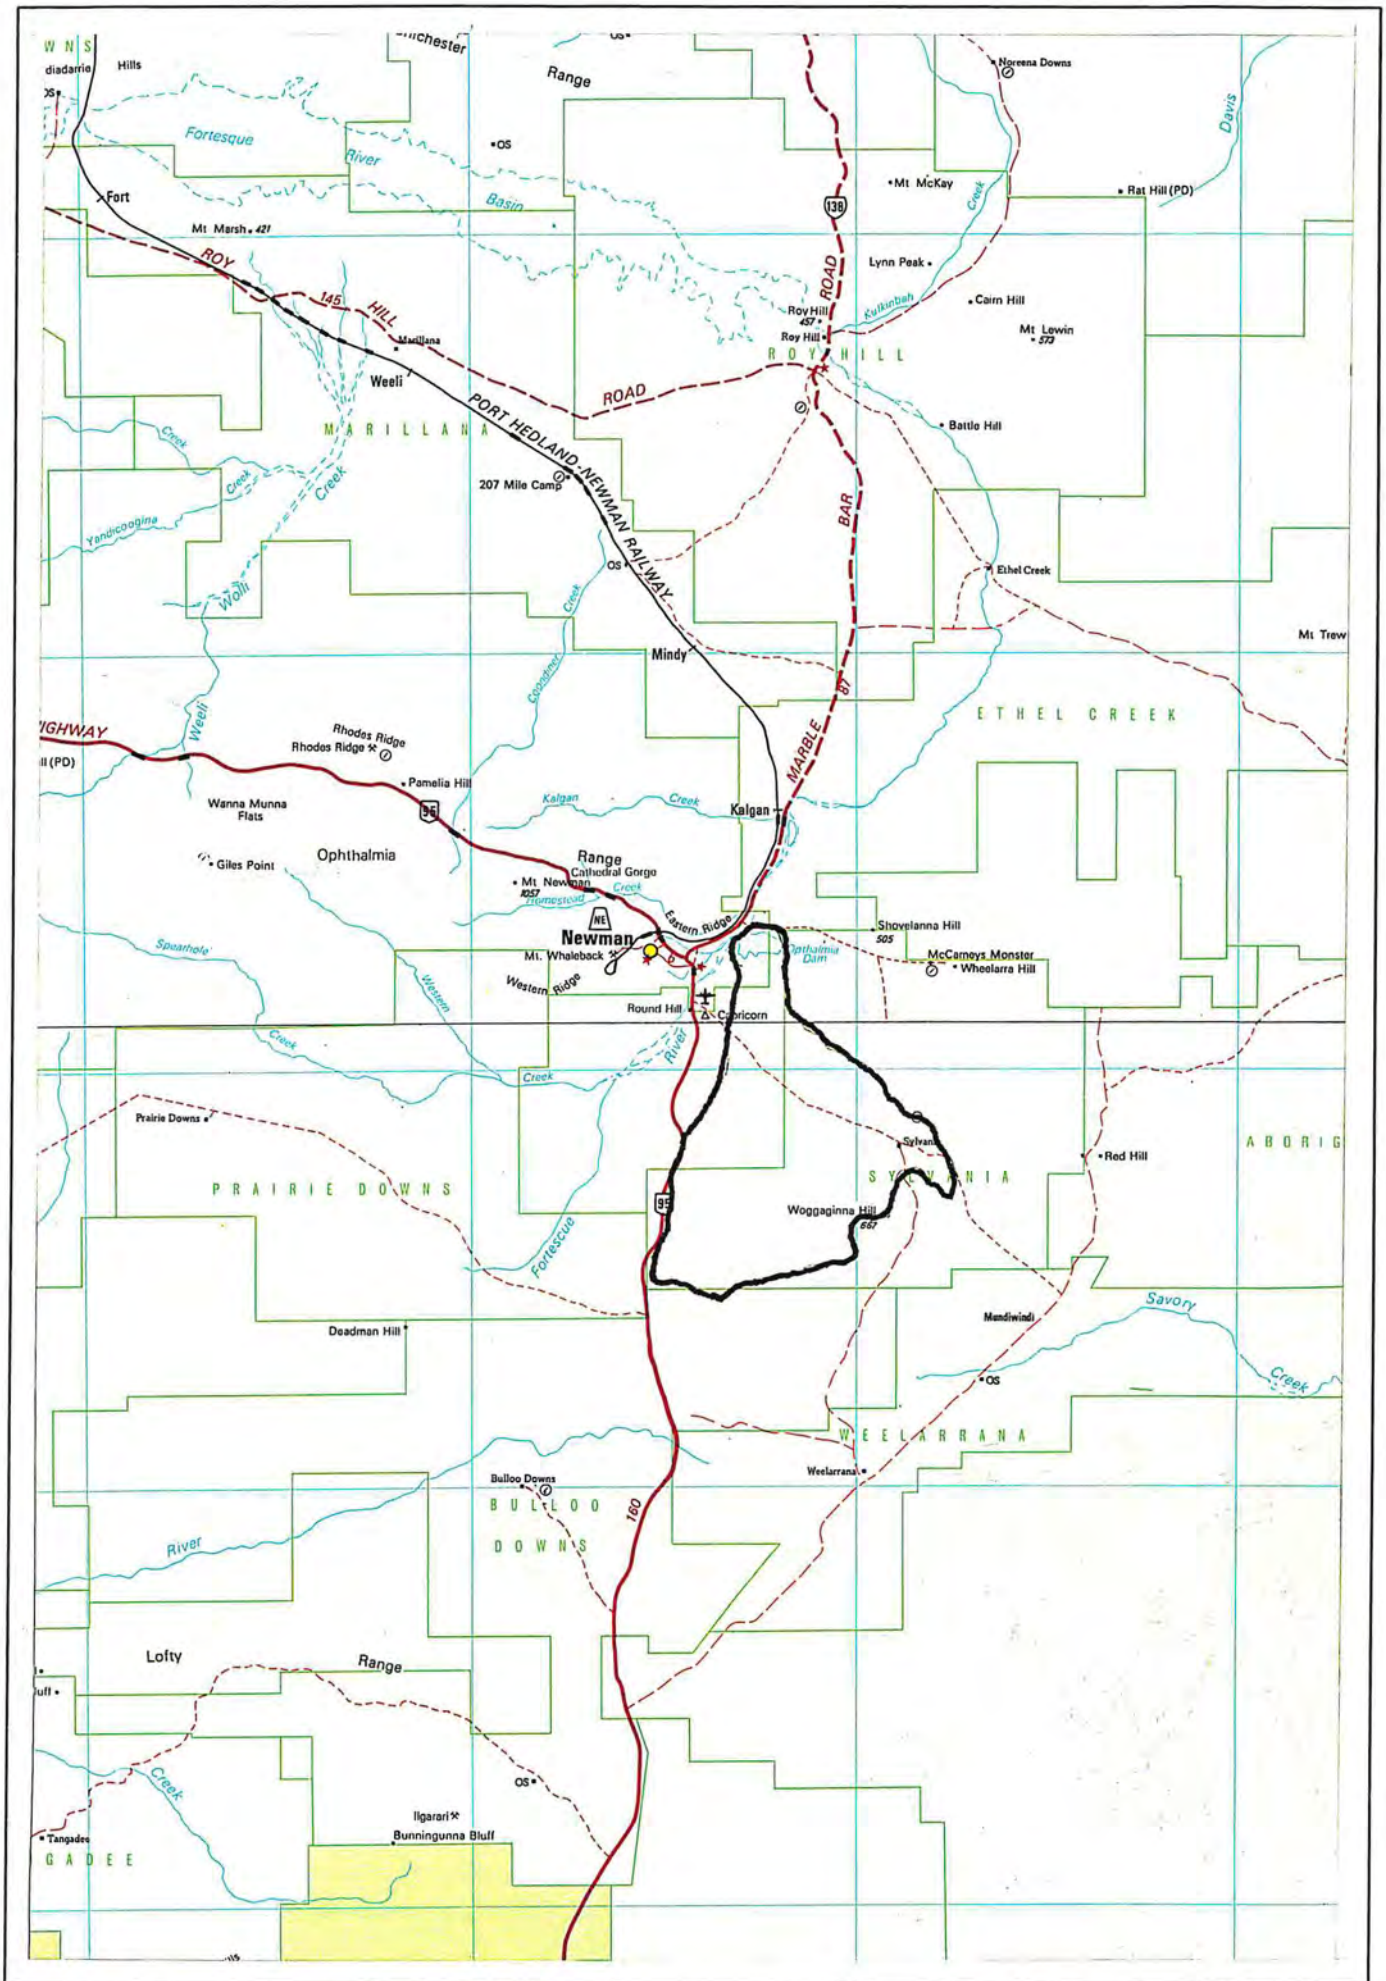
Existing Developments:

WC:
Other:
Current uses: aquifer recharge.

Possible future uses:

Factors (environmental, social and economic) which may affect future development:

Comments:



Fortescue River

Surface Water Source: Fortescue River

River Basin: Fortescue **AWRC Basin No: 708**

Location: DS48 (Bullinnarwa)
7 635 200 m N, 414 500 m E

Catchment Details:

Area:	18 500 km^2 (for 1 in 100 year flood the area is 50 200 km^2)
Average rainfall:	250 - 350 mm/annum
Pan evaporation:	3400 - 3800 mm/annum
Alienated:	60%
Cleared:	No significant clearing, but some overgrazing of river frontages.
Land use:	40% vacant Crown land and Reserves, 60% cattle and sheep on pastoral leases.

Mean Annual Flow (GL/year):	200
Estimated Divertible Yield (GL/year):	54

Water Quality:

Salinity:	Fresh.
Other significant parameters:	Turbidity high in high flow events.

Existing Developments:

WC:	None.
Other:	None.
Current uses:	None.

Possible future uses:

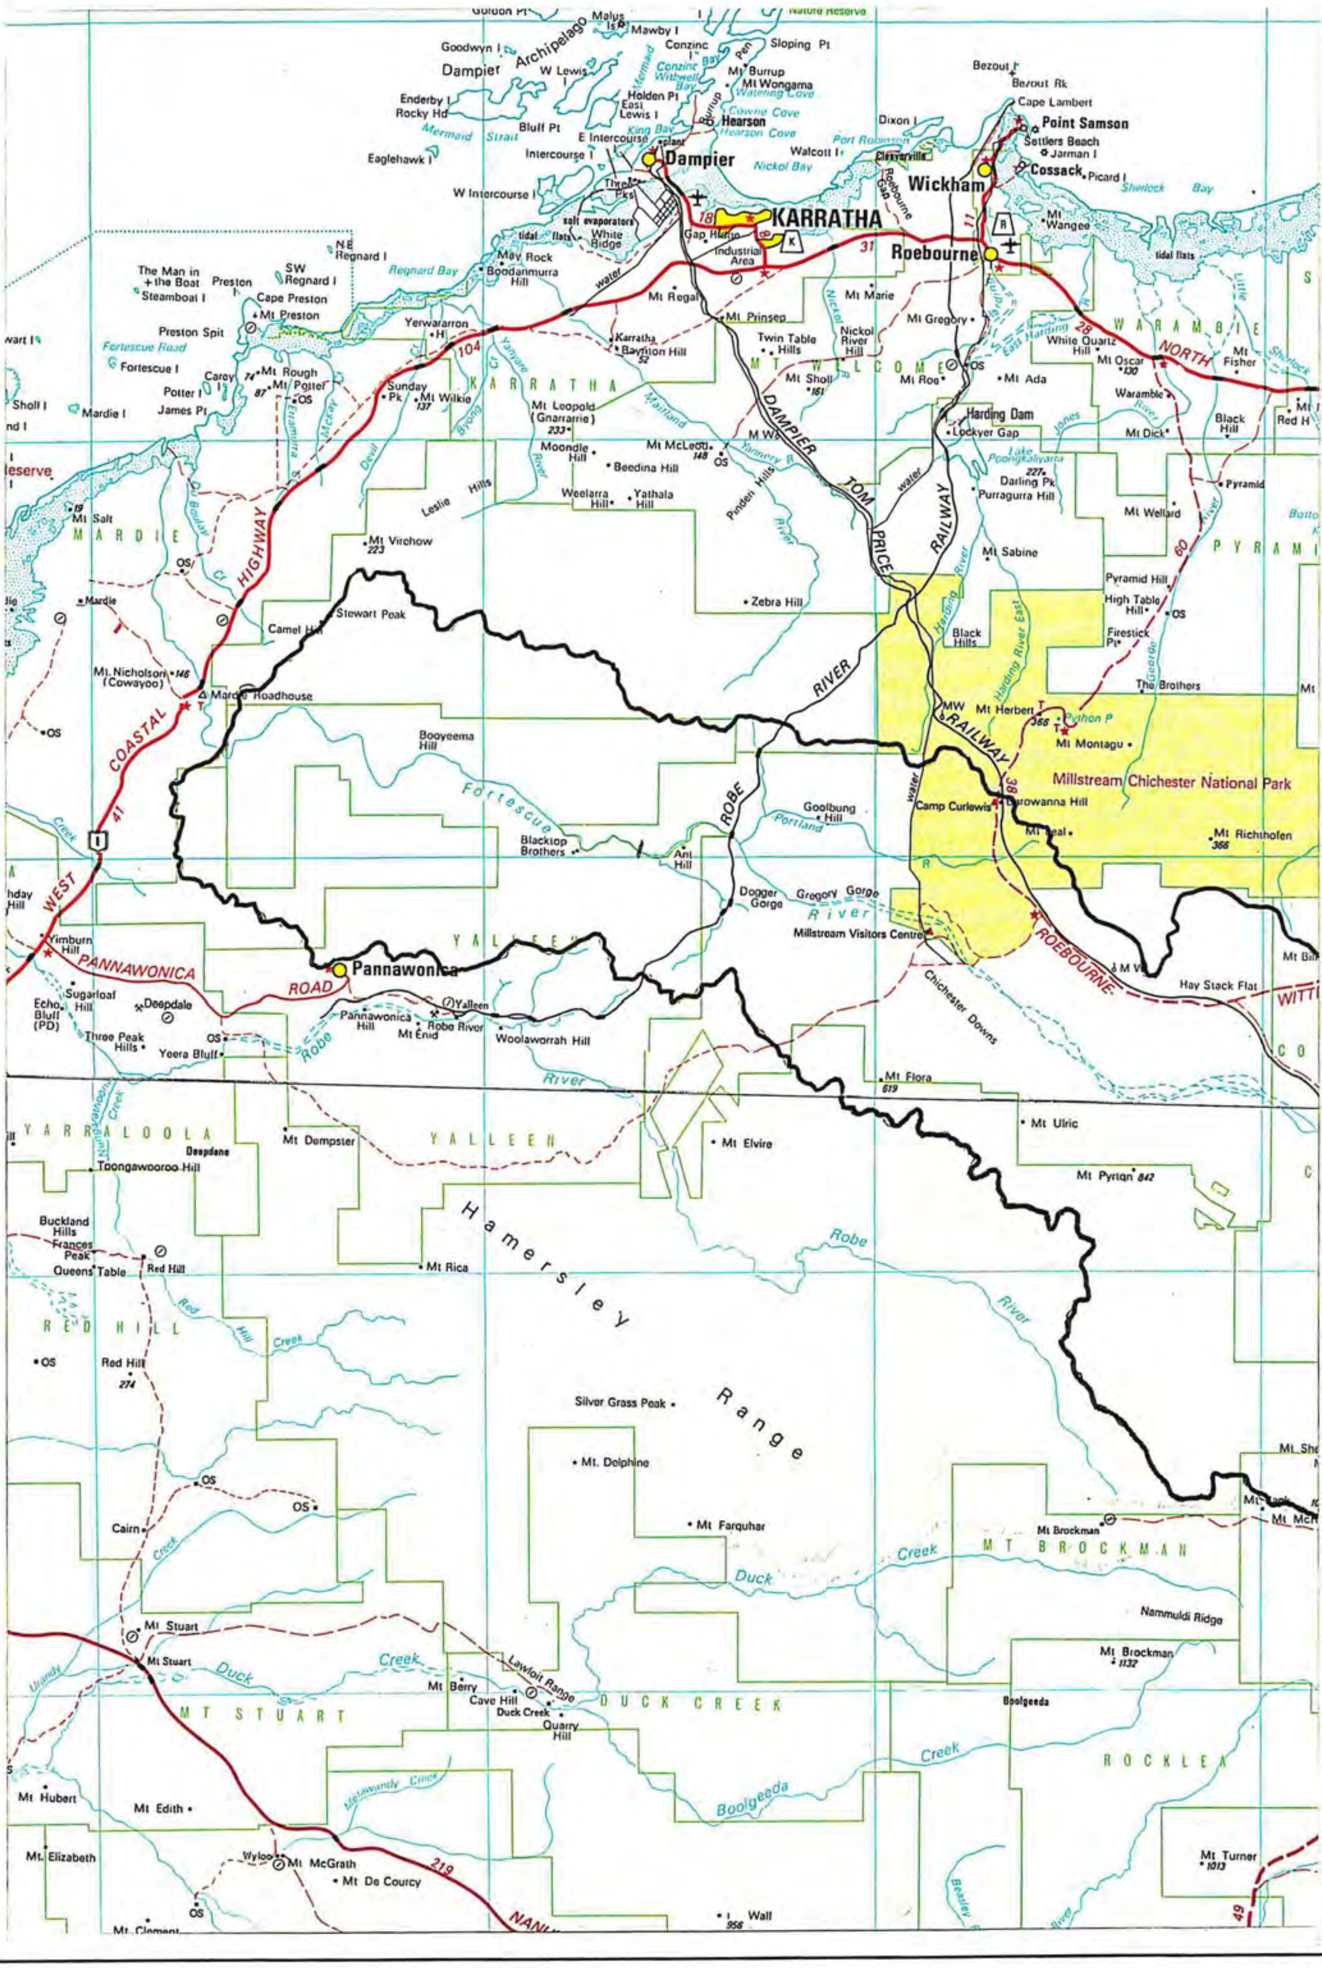
Possible water supply for West Pilbara development.

Factors (environmental, social and economic) which may affect future development:

1. Possible Aboriginal sites.
2. Construction of a dam at Bullinnarwa would have an impact on the environment.

Comments:

The reliability of data on the mean annual flow and estimated divertible flow is good. Treatment for turbidity may be required. A dam on the Fortescue River, at Bullinnarwa, could be used in isolation, without groundwater augmentation.



Fortescue River

Surface Water Source:	Fortescue River

River Basin: Fortescue **AWRC Basin No: 708**

Location: DS123 (Booyeemala)
7 622 400 m N, 471 000 m E

Catchment Details:

Area:	16 200 km^2
Average rainfall:	250 - 350 mm/annum
Pan evaporation:	3400 - 3800 mm/annum
Alienated:	60%
Cleared:	No significant clearing, but some overgrazing of river frontages.
Land use:	40% vacant Crown land and Reserves, 60% cattle and sheep on pastoral leases.

Mean Annual Flow (GL/year): 147
Estimated Divertible Yield (GL/year): 42

Water Quality:

Salinity:	Fresh.
Other significant parameters:	Turbidity high in high flow events.

Existing Developments:

WC:	None.
Other:	None.
Current uses:	None.

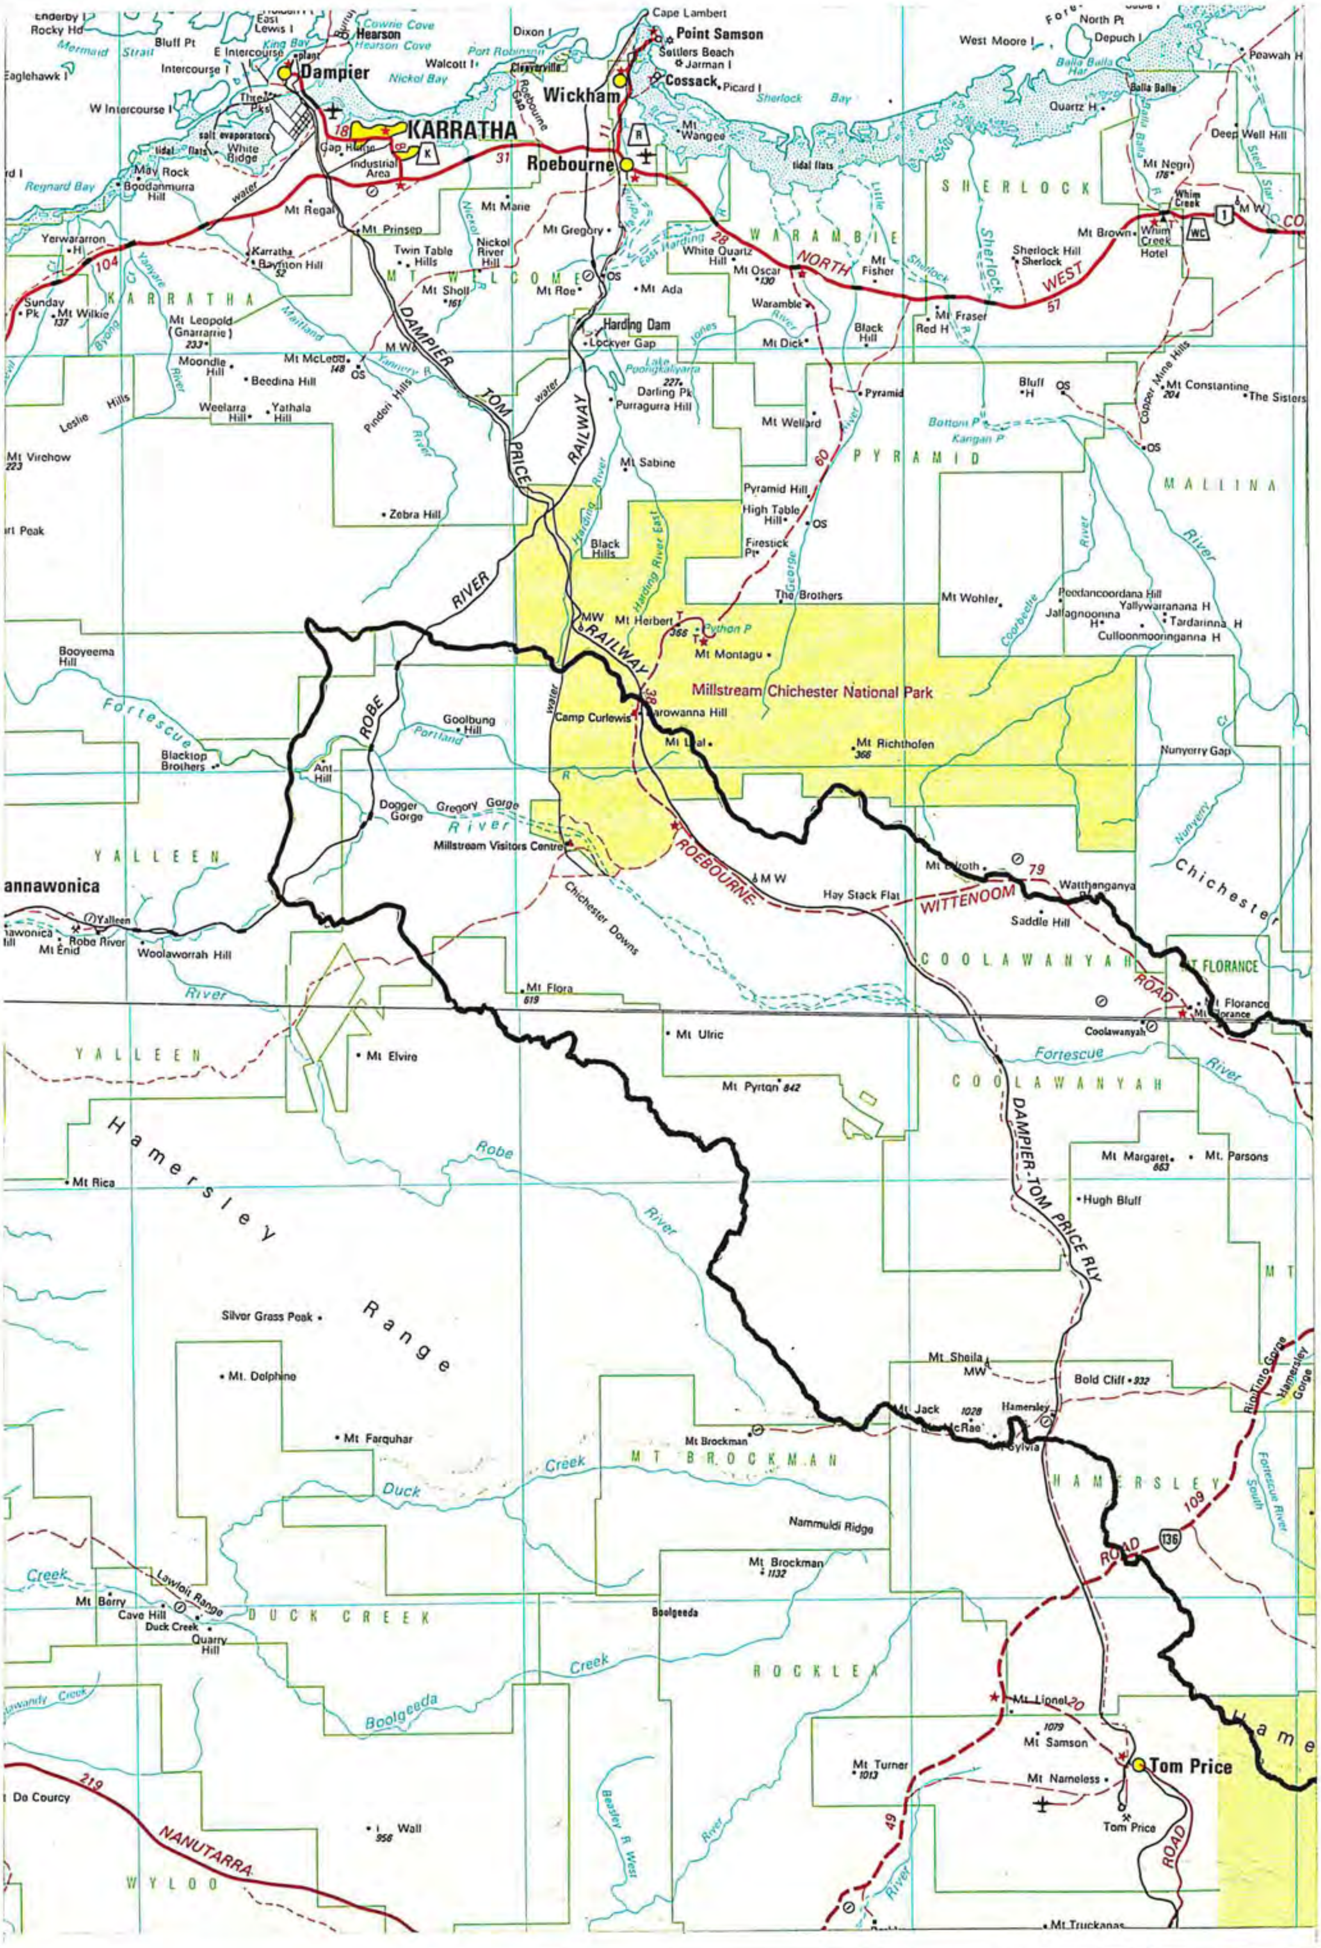
Possible future uses:

Possible water supply for West Pilbara development.

Factors (environmental, social and economic) which may affect future development:

1. The biological impact (the loss of riverine vegetation and permanent pool ecosystems) would be small in relation to those of most other reservoirs.
2. There would be an adverse impact on aquatic ecosystems located downstream of the dam. However, the severity of this impact could be reduced, if necessary, by controlled release of water from the reservoir.
3. Loss of numerous Aboriginal engravings and development within the area of the "ancestral route" which is an important feature of the mythology of traditional Aborigines. However, the reservoir would not affect any known sacred sites.
4. The reservoir would constitute a new tourist attraction and potential recreational resource.

Comments:
The reliability of estimated divertible flow is good. Treatment for turbidity may be required. A dam at Booyeemala could be used as an independent water supply.



Fortescue River

Surface Water Source: Yule River

River Basin: Port Hedland Coast **AWRC Basin No: 709**

Location: DS95 (Kangan Pool)
7 664 000 m N, 651 000 m E

Catchment Details:

Area:	7830 km^2
Average rainfall:	300 mm/annum
Pan evaporation:	3500 - 3700 mm/annum
Alienated:	70%
Cleared:	No significant clearing, but some overgrazing of native vegetation along river frontages.
Land use:	30% vacant Crown land and Reserves, 70% cattle and sheep on pastoral leases.

Mean Annual Flow (GL/year):	184
Estimated Divertible Yield (GL/year):	8.0

Water Quality:

Salinity:	Fresh.
Other significant parameters:	Turbidity high in high flow events.

Existing Developments:

WC:	None.
Other:	None.
Current uses:	None.

Possible future uses:

1. The main value of the storage will be its ability to recharge the major groundwater aquifer downstream of the site.
2. Water could be pumped on for the recharge of the Turner River aquifers.

Factors (environmental, social and economic) which may affect future development:

1. The permanent pool at the site has always been a haven for bird and animal life and the pool itself is usually well stocked with fish.
2. A major alluvial gold mining operation has been operating in the area.
3. The catchment for the storage lies in the immediate locality of the Yandearra Aboriginal Community who have a strong interest in the area.

Comments:

The reliability of data on the mean annual flow and estimated divertible flow is fair. Treatment for turbidity may be required. Additional divertible yield may be possible if this source is developed conjunctively with groundwater.

Yule River

Surface Water Source: Sherlock River

River Basin: Port Hedland Coast **AWRC Basin No: 709**

Location: DS48 (Kangan Pool)
7 667 000 m N, 565 500 m E

Catchment Details:

Area:	4140 km^2
Average rainfall:	300 mm/annum
Pan evaporation:	3500 - 3600 mm/annum
Alienated:	
Cleared:	
Land use:	

Mean Annual Flow (GL/year):	172
Estimated Divertible Yield (GL/year):	8.3

Water Quality:

Salinity:	Fresh.
Other significant parameters:	Highly variable, improves dramatically at high flows.

Existing Developments:

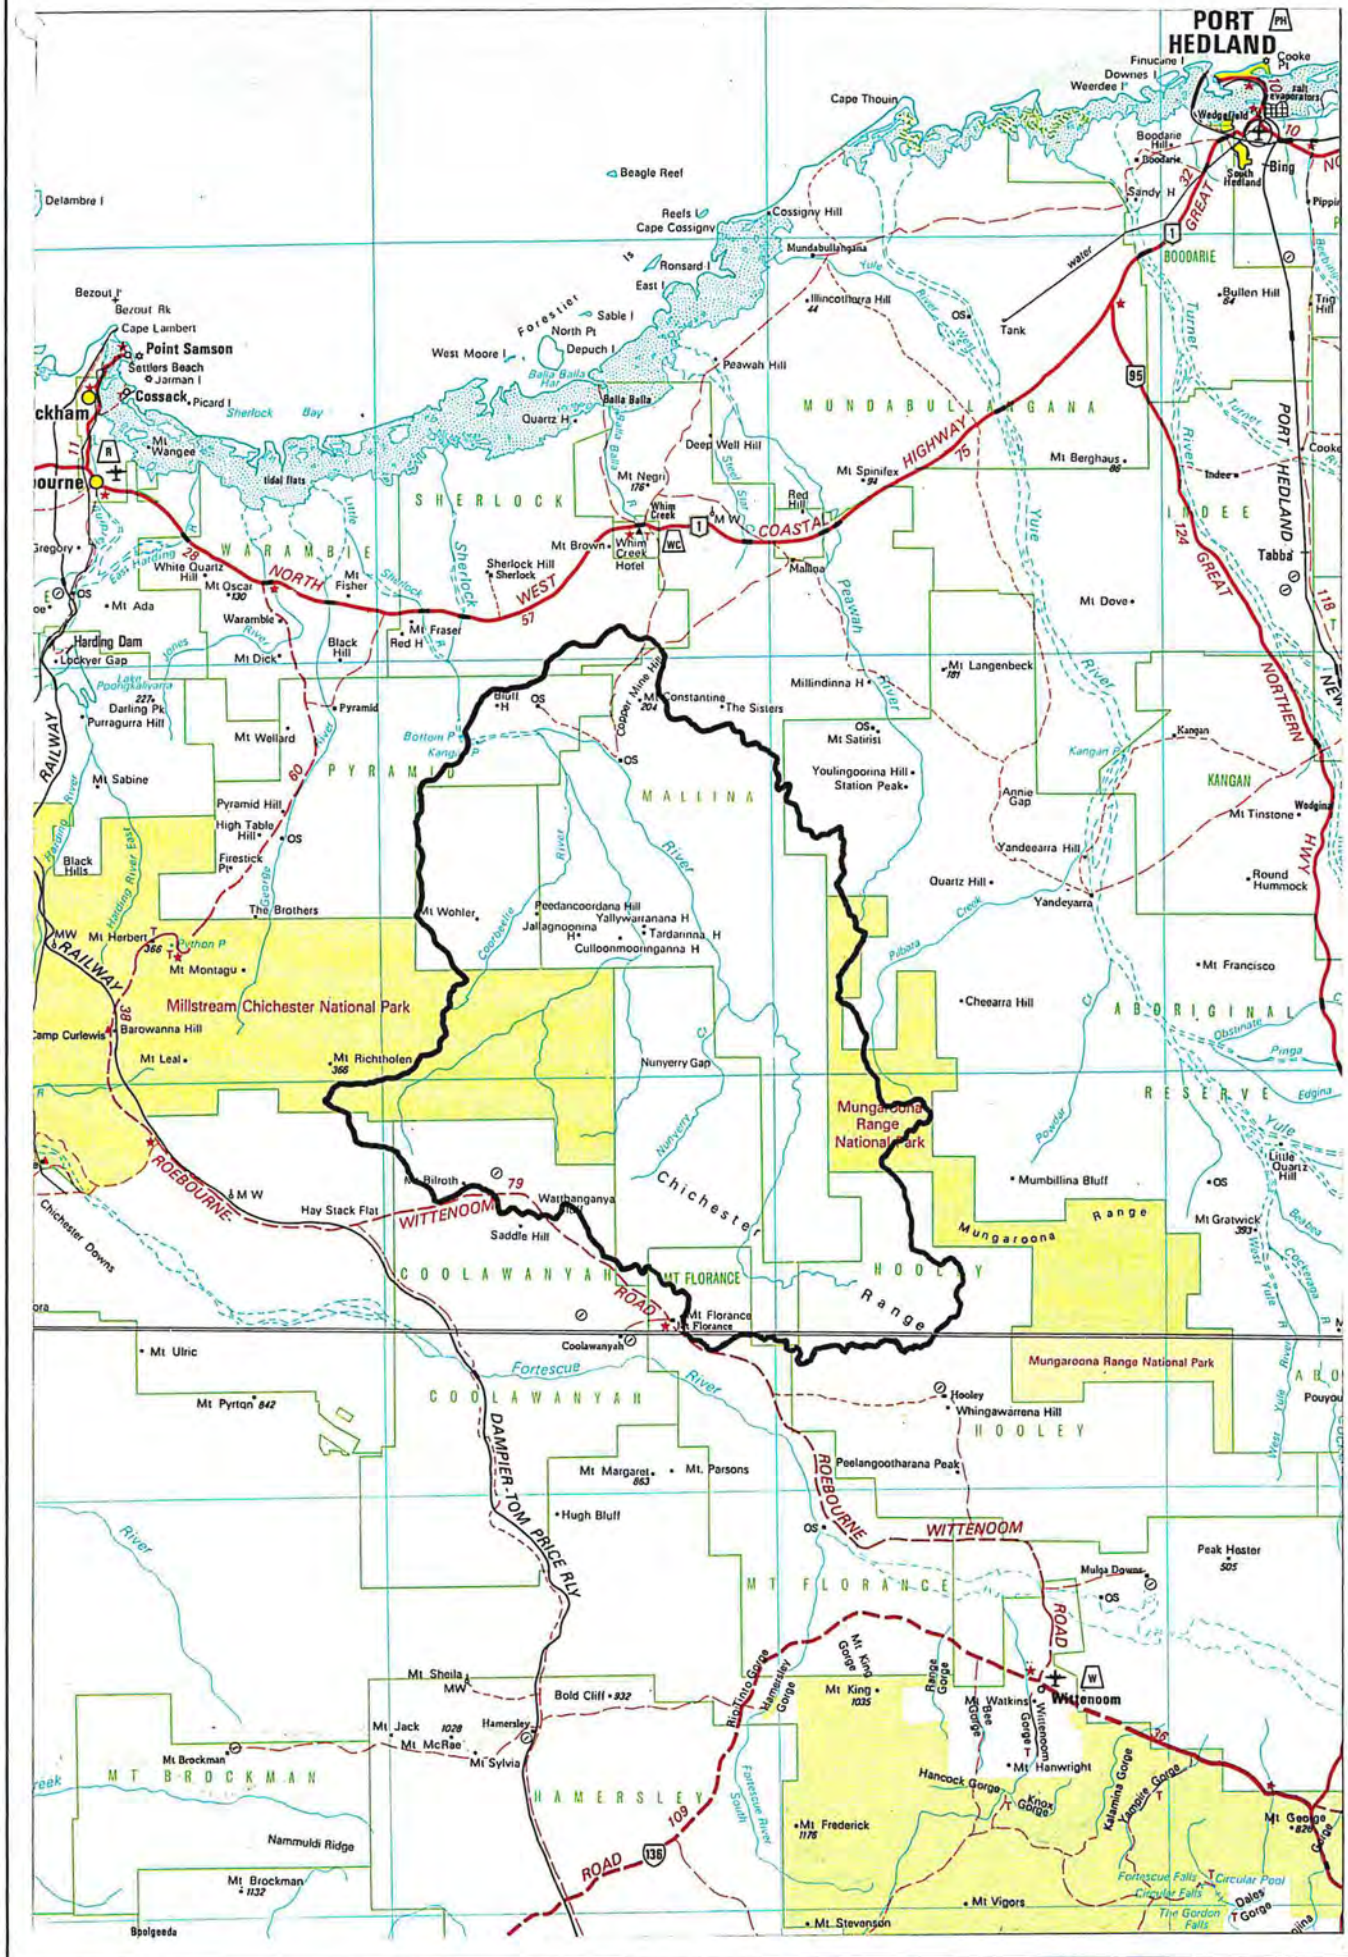
WC:	None.
Other:	None.
Current uses:	None.

Possible future uses:
This site, in conjunction with the Nunyerry storage, is very promising as a conjunctive use option for supply to the West Pilbara independently of the Harding/Millstream system.

Factors (environmental, social and economic) which may affect future development:

1. Loss of extensive areas of River Gum forests and woodlands adjacent to the Sherlock River and its tributaries. However, this vegetation is well represented outside the reservoir limits.
2. Loss of temporary pools, one of which is an important habitat for water birds. The permanent pools would not be inundated.
3. There is a relatively high risk of eutrophic conditions developing in the Sherlock Reservoir.
4. The area of inundation would be 102 km^2 at FSL. During periods when the water level is low large areas of the reservoir bed will be exposed.
5. The reservoir will provide an unsuitable habitat for many of the existing aquatic species.
6. Inundation of several Aboriginal habitation sites and at least one ceremonial site.
7. Loss of approximately 9% of the grazing land of Pyramid Station.

Comments:
The reliability of data on the mean annual flow and estimated divertible flow is fair. Treatment for turbidity may be required. Additional divertible flow of approximately 20 GL available if used in conjunction with another source. A dam on the Sherlock River at Kangan Pool could not be used as an independent source.



Sherlock River

Surface Water Source: Nunyerry Creek

River Basin: Port Hedland Coast **AWRC Basin No: 709**

Location: DS9
7 624 500 m N, 595 000 m E

Catchment Details:

Area:	300 km^2
Average rainfall:	300 mm/annum
Pan evaporation:	3500 - 3600 mm/annum
Alienated:	
Cleared:	
Land use:	

Mean Annual Flow (GL/year):	10
Estimated Divertible Yield (GL/year):	5

Water Quality:

Salinity:	Fresh.
Other significant parameters:	Highly variable, improves dramatically at high flows.

Existing Developments:

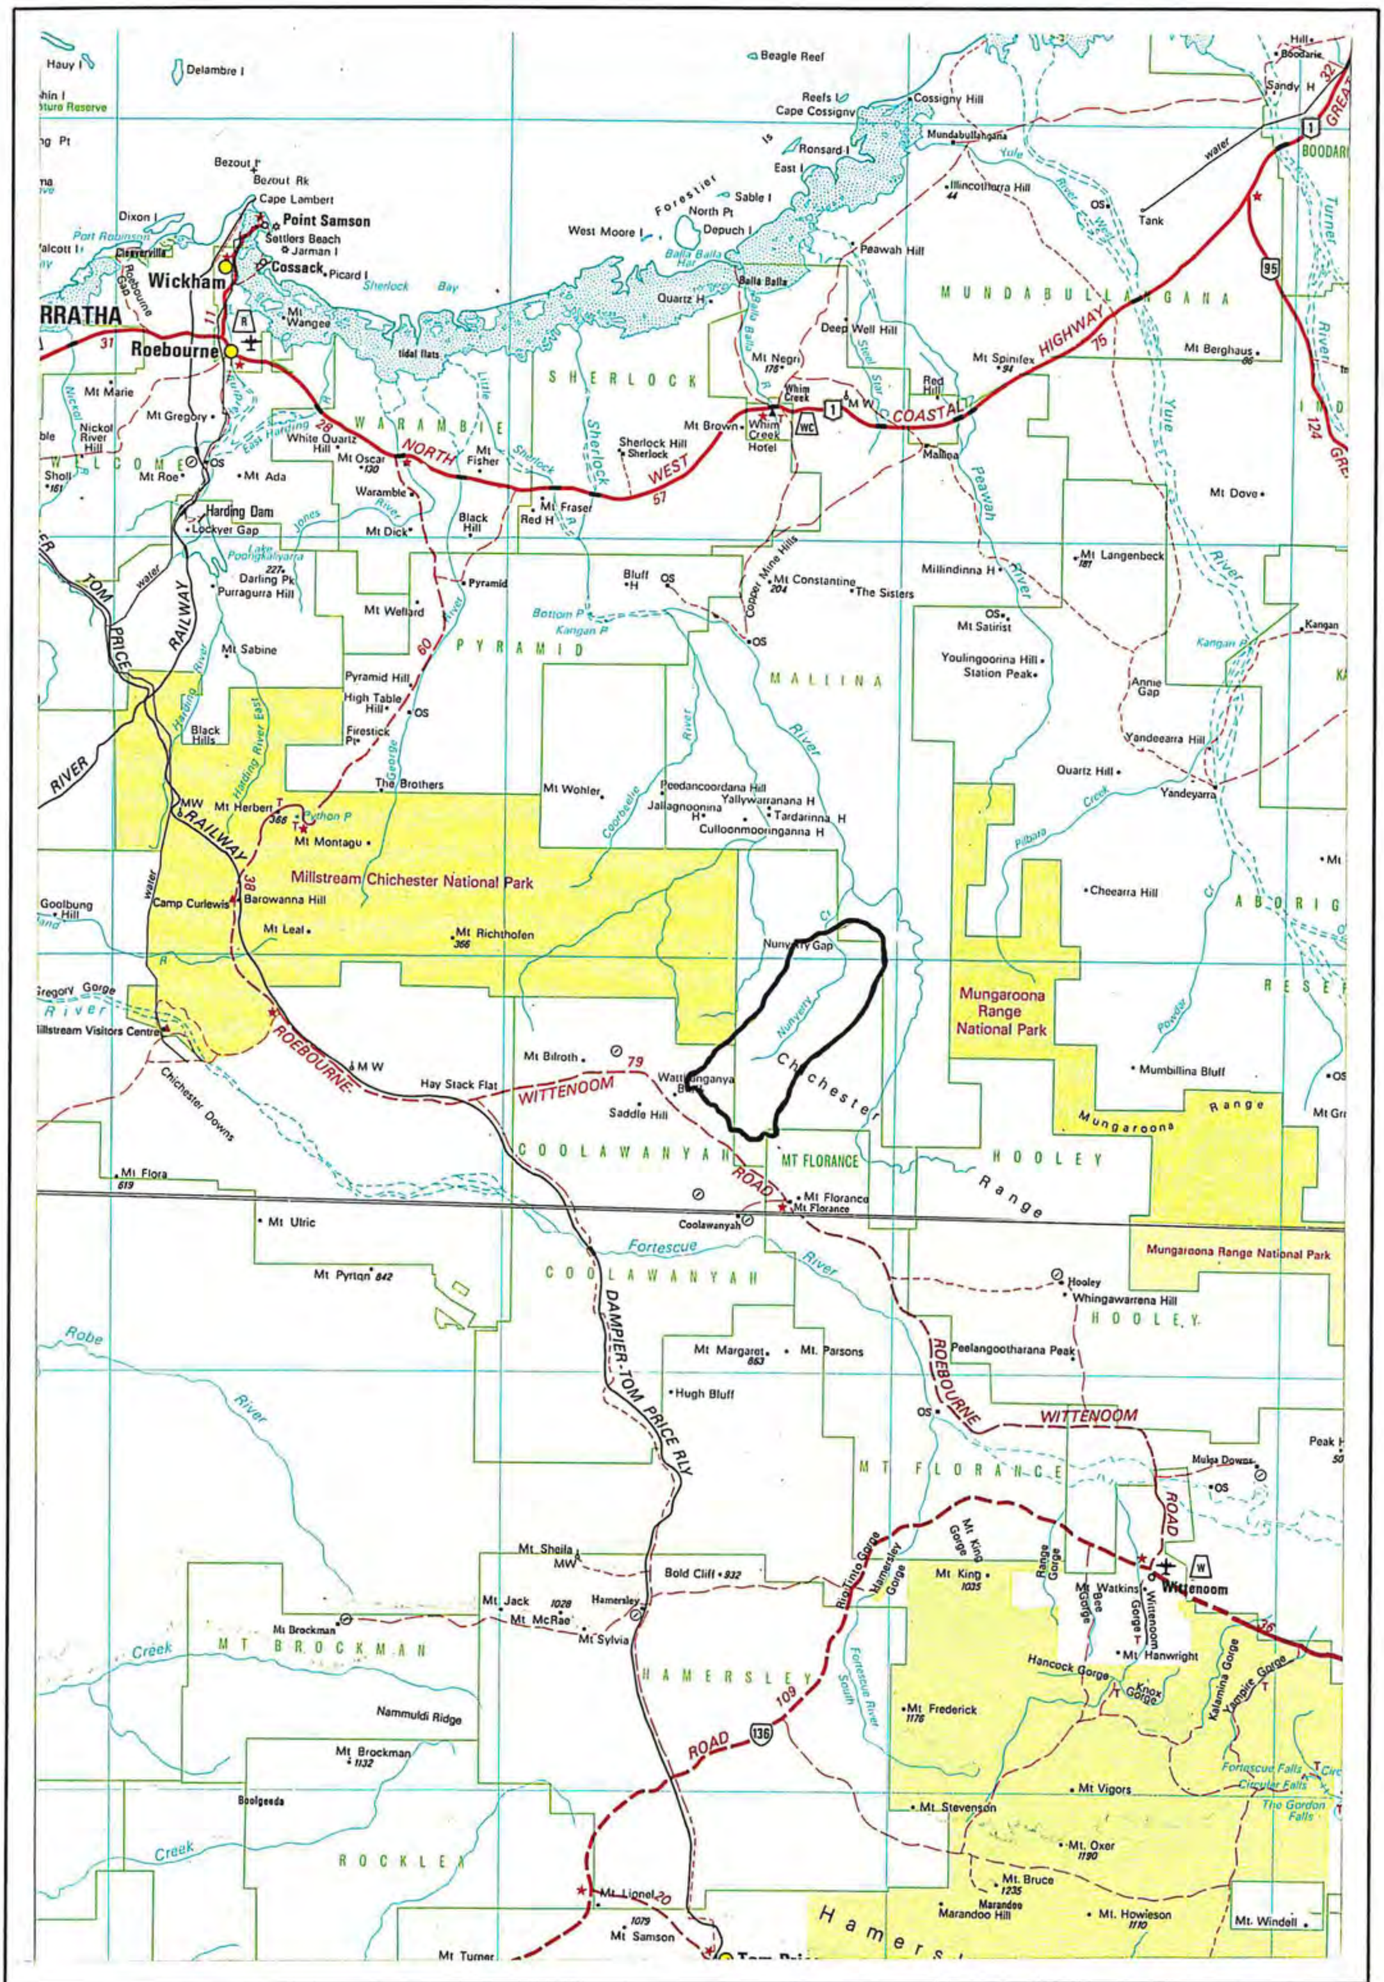
WC:	None.
Other:	None.
Current uses:	None.

Possible future uses:
This site, in conjunction with the Sherlock storage, is very promising as a conjunctive use option for supply to the West Pilbara independently of the Harding/Millstream system.

Factors (environmental, social and economic) which may affect future development:

1. Loss of vegetation including riverine River Gum woodlands and shrublands. Larger areas of the vegetation types would remain upstream and downstream of the reservoir and along other creeks in the region.
2. Loss of temporary pools and one permanent pool. However, such habitats are widespread in the region. There would also be some threat to the more biologically valuable pool at Ellawarrina Spring if the reservoir was to lead to tourist usage of that area.
3. Development of the reservoir would have beneficial impacts both as a tourist and recreational site and as a new aquatic habitat. In this latter respect, its stability compared to other reservoirs under consideration would make it more biologically valuable, especially for migratory birds.

Comments:
The reliability of data on the mean annual flow and estimated divertible flow is fair. Treatment for turbidity may be required. The estimated divertible yield can be increased by 17 GL if used in conjunction with Sherlock River - Kangan Pool and another source.



Nunyerri Creek

Surface Water Source:	Munni Munni Creek

River Basin: Port Hedland Coast **AWRC Basin No: 709**

Location: DS15
7 664 400 m N, 483 500 m E

Catchment Details:

Area: 574 km^2 (assumes the Maitland River is also dammed where the catchment boundary for Munni Munni Creek is close to Maitland River).
Average rainfall: 300 mm/annum
Pan evaporation: 3500 - 3600 mm/annum
Alienated:
Cleared:
Land use:

Mean Annual Flow (GL/year): 20
Estimated Divertible Yield (GL/year): 1.5

Water Quality:

Salinity:
Other significant parameters:

Existing Developments:

WC:
Other:
Current uses:

Possible future uses:

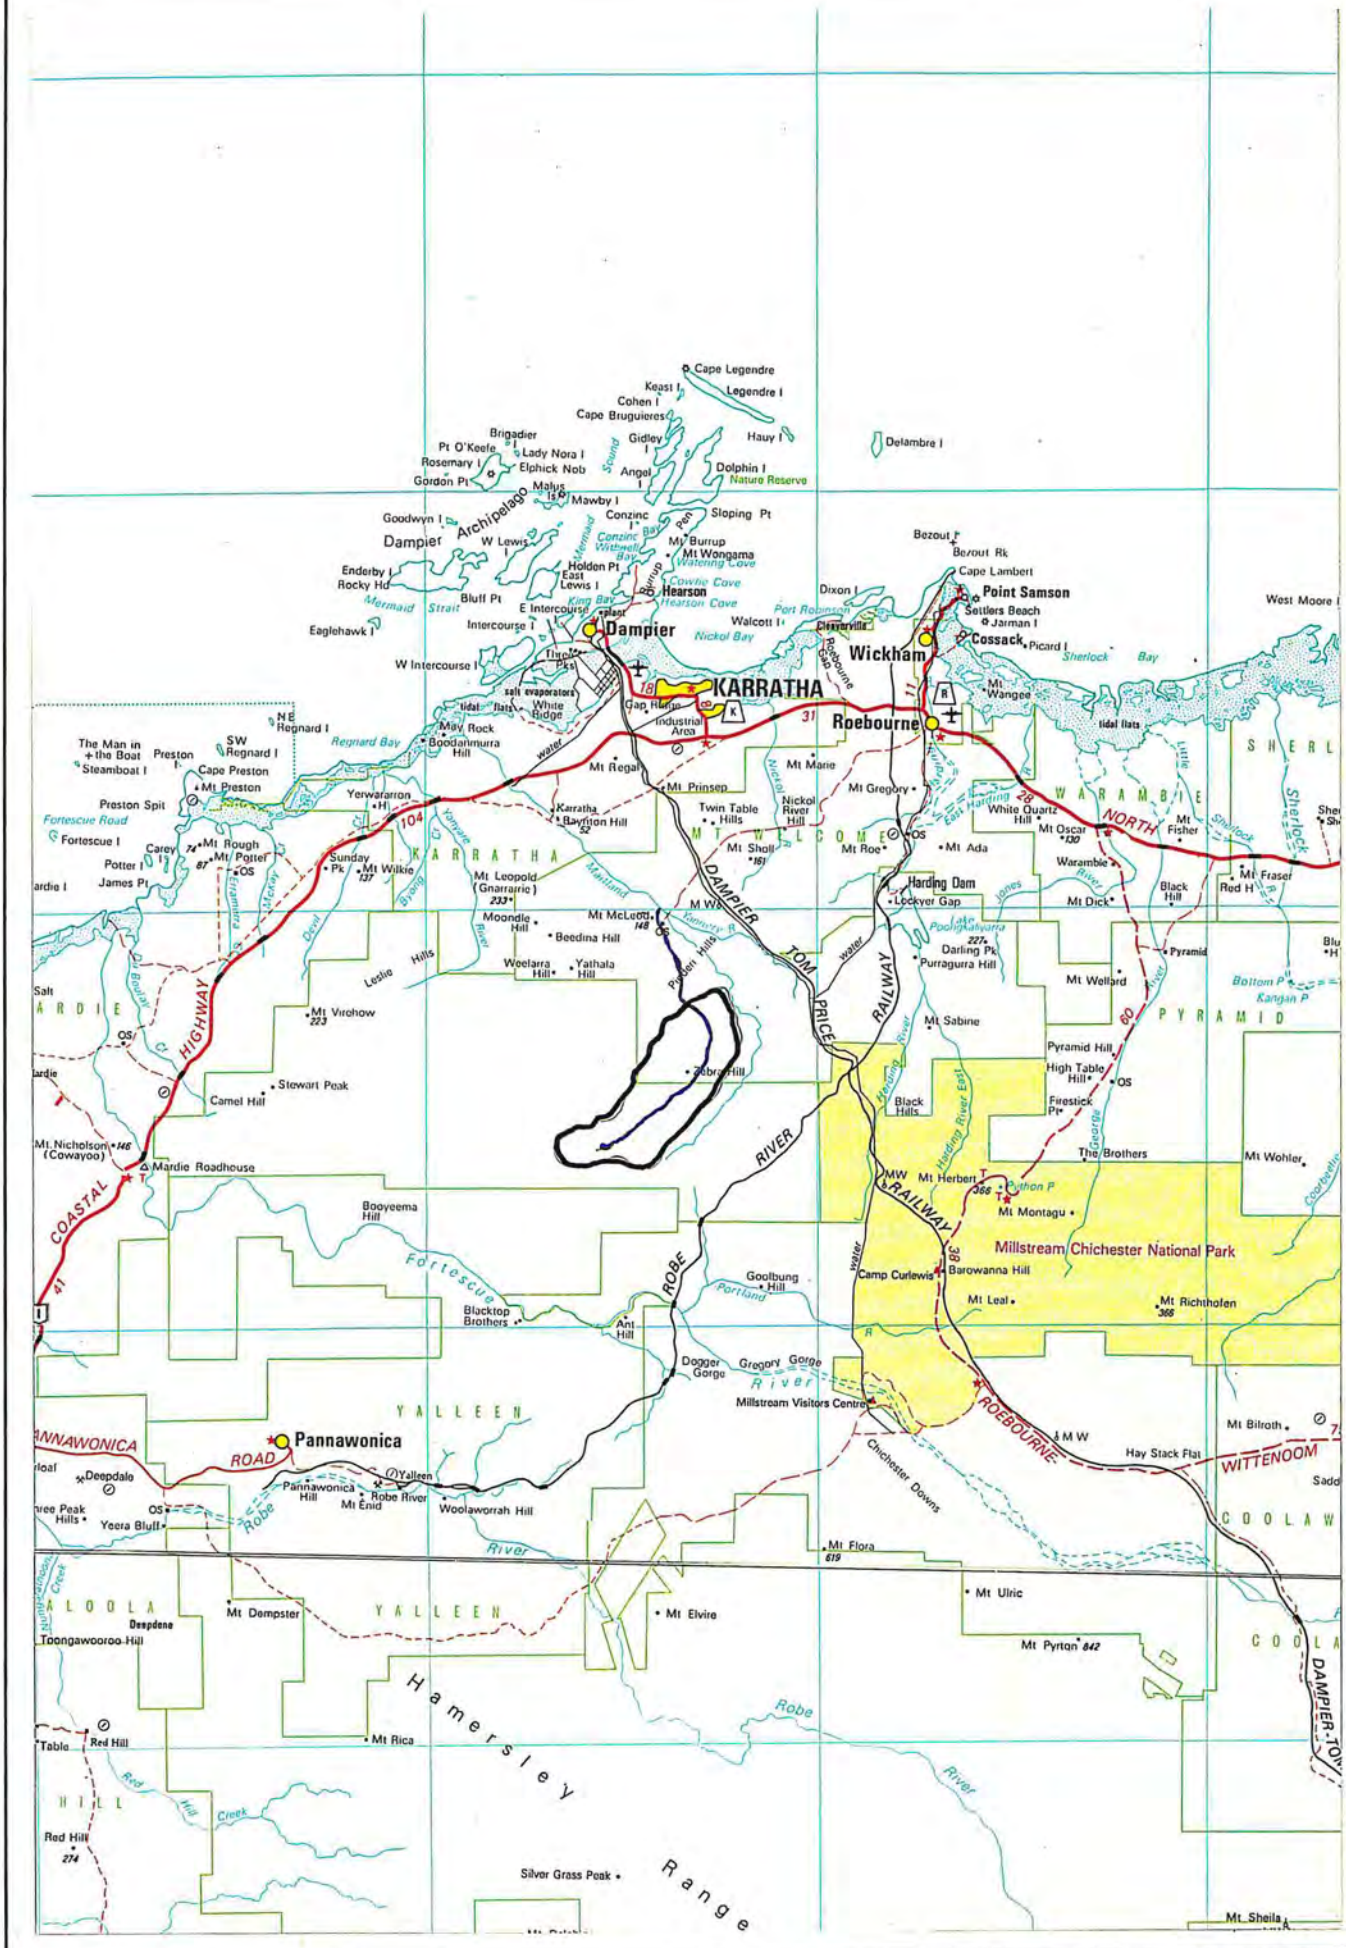
Possible water supply for West Pilbara development.

Factors (environmental, social and economic) which may affect future development:

1. Possible Aboriginal sites in the area.
2. The construction of a dam on Munni Munni Creek and the low barrage structure across the Maitland River would have an environmental impact in the area.
3. The area has a large number of well developed petroglyphs.

Comments:

The reliability of data for mean annual flow and estimated divertible flow is poor. A water supply on Munni Munni Creek could not be used as an independent source because yield from the catchment is not reliable on an annual basis.



Munni Munni Creek

Surface Water Source: Harding River

River Basin: Port Hedland Coast **AWRC Basin No: 709**

Location: Harding Dam

Catchment Details:

Area:	1020 km^2
Average rainfall:	330 mm/annum
Pan evaporation:	3400 mm/annum
Alienated:	50%
Cleared:	No significant clearing, but considerable over grazing on valley plains.
Land use:	About 50% in National Park, remainder sheep and cattle grazing on pastoral leases.

Mean Annual Flow (GL/year):	38
Estimated Divertible Yield (GL/year):	15

Water Quality:

Salinity:
Other significant parameters:

Existing Developments:

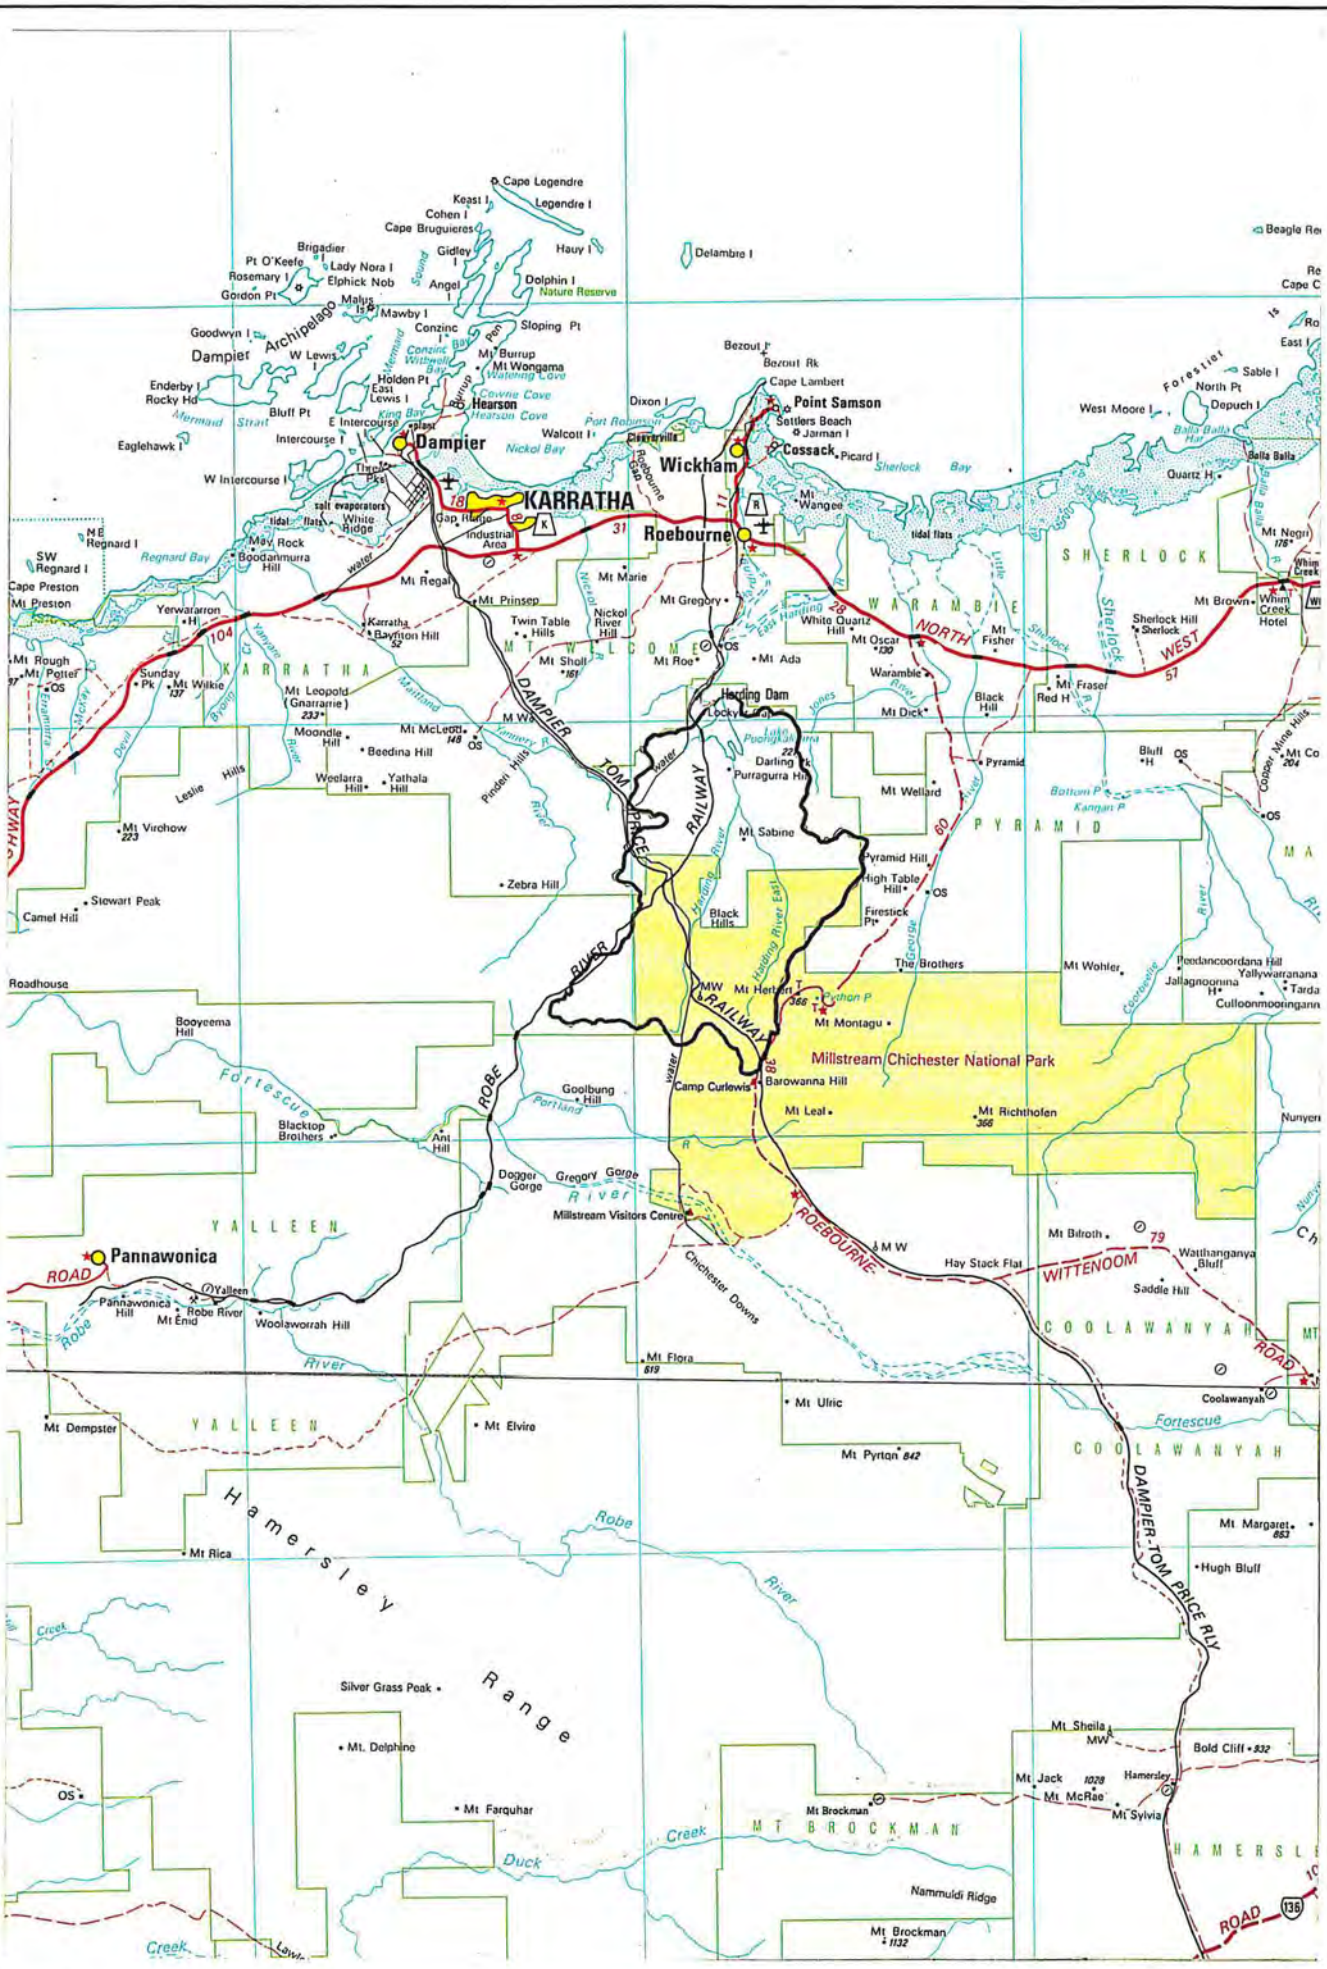
WC:
Other:
Current uses: West Pilbara Water Supply Scheme.

Possible future uses:

Factors (environmental, social and economic) which may affect future development:

Comments:

The reliability of data for mean annual flow and estimated divertible flow is good.



Harding River

Surface Water Source:	Shaw River

River Basin: DeGrey **AWRC Basin No: 710**

Location: DS88 (North Pole)
7 665 600 m N, 740 500 m E

Catchment Details:

Area:	6500 km^2
Average rainfall:	250 - 350 mm/annum
Pan evaporation:	3600 mm/annum
Alienated:	65%
Cleared:	No significant clearing, but some overgrazing along valley plains.
Land use:	35% vacant Crown land and Reserves, 65% cattle and sheep on pastoral leases.

Mean Annual Flow (GL/year):	180
Estimated Divertible Yield (GL/year):	80

Water Quality:

Salinity:	Fresh.
Other significant parameters:	Highly variable, improves at high flows.

Existing Developments:

WC:	None.
Other:	None.
Current uses:	None.

Possible future uses:

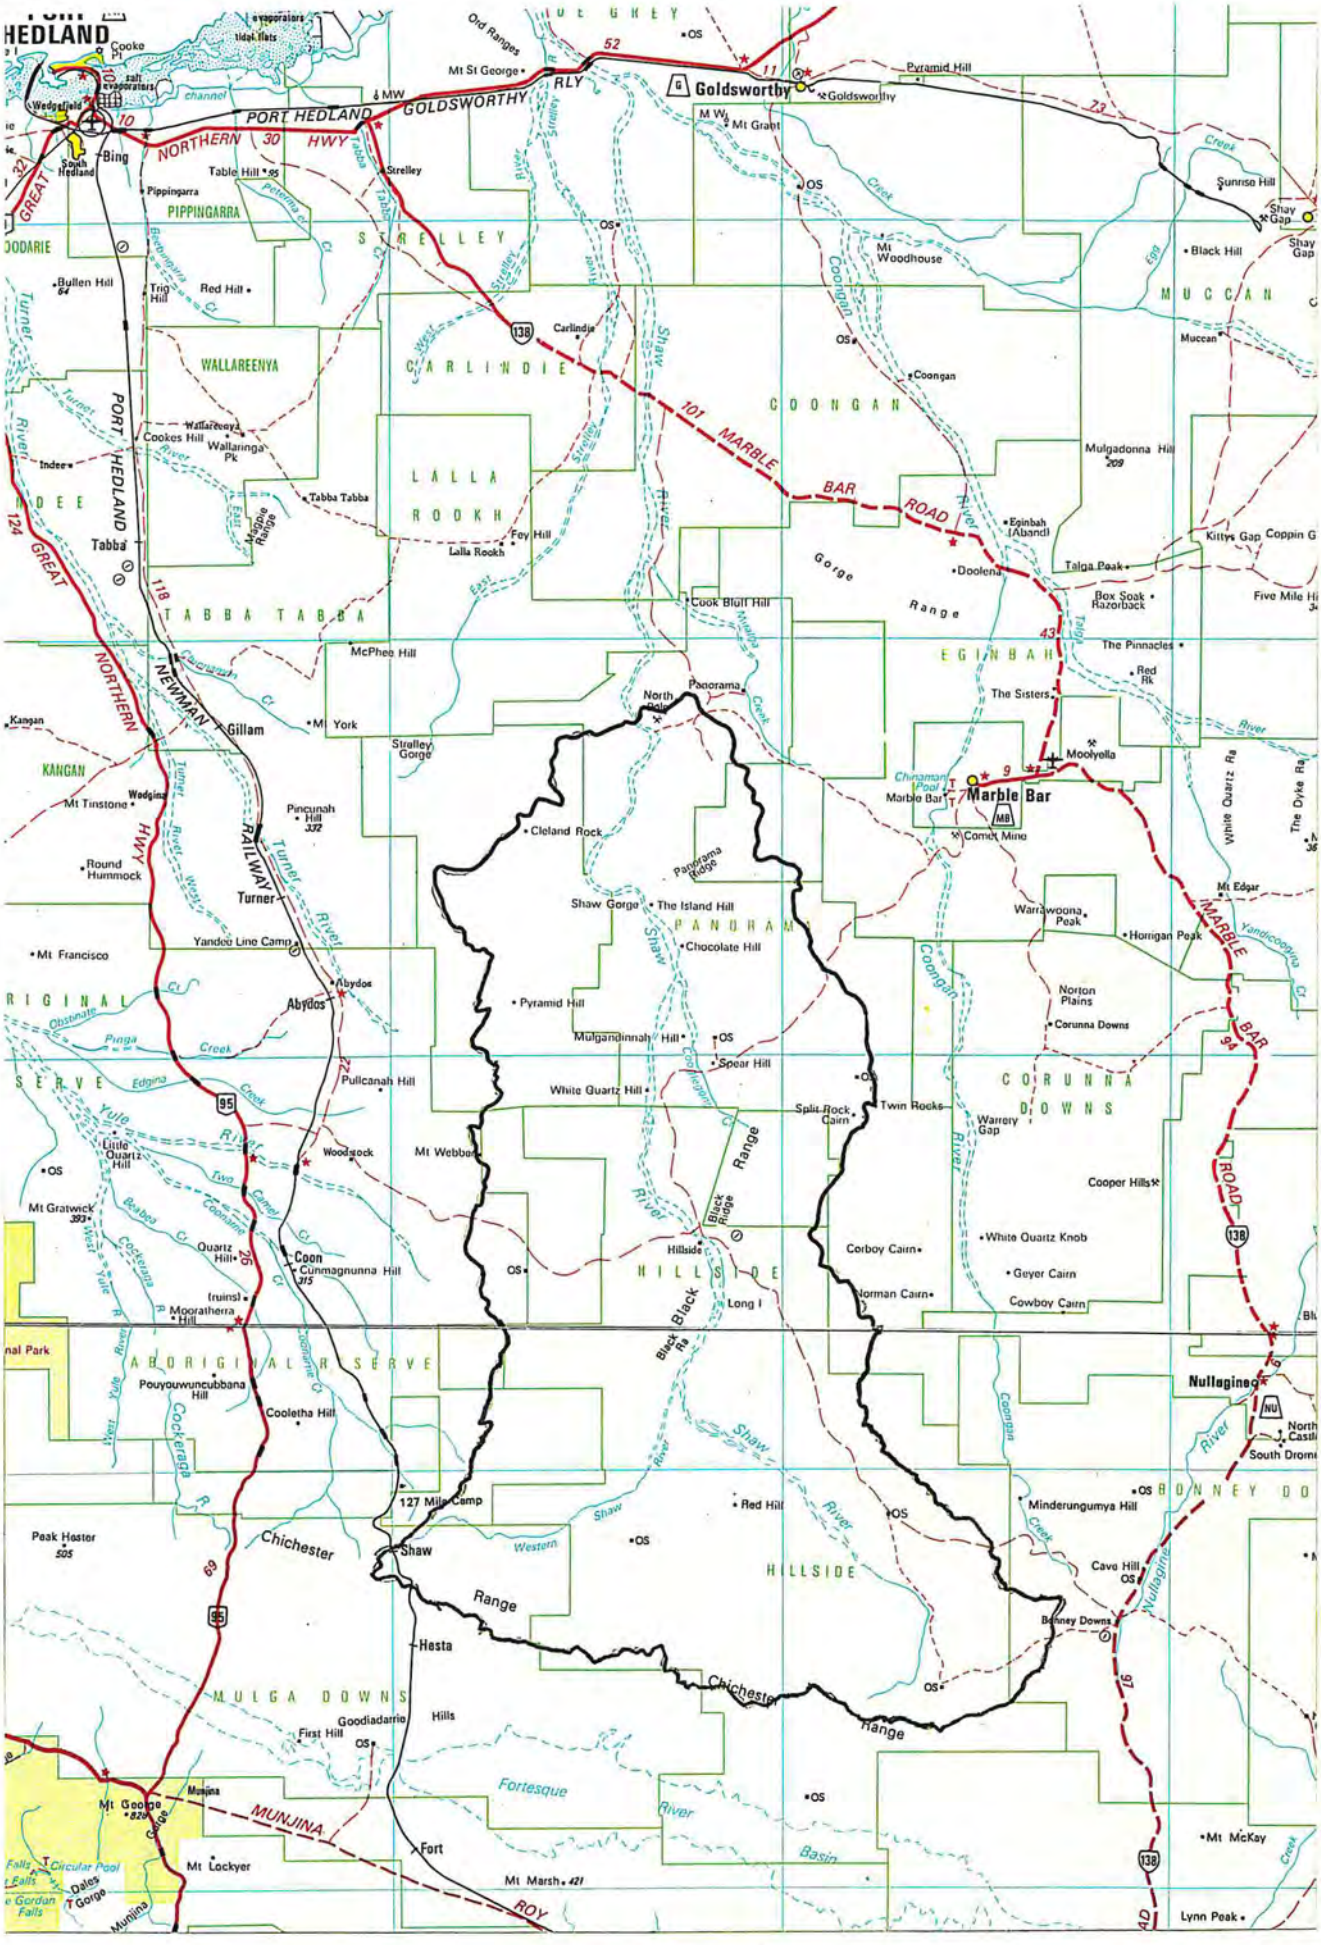
The North Pole dam must be one of the best potential sources of water in the Pilbara and must be considered as a prime source of water for developments in Port Hedland.

Factors (environmental, social and economic) which may affect future development:

Current mining claims overly the North Pole dam site.

Comments:

The reliability of data on the mean annual flow and estimated divertible flow is fair. Treatment for turbidity may be required.



Shaw River

Surface Water Source:	Coongan River

River Basin: DeGrey **AWRC Basin No: 710**

Location: DS54 (Doolena Gap)
7 683 200 m N, 789 800 m E

Catchment Details:

Area:	4310 km^2
Average rainfall:	300 mm/annum
Pan evaporation:	3600 mm/annum
Alienated:	60%
Cleared:	No significant clearing, but some overgrazing along valley plains.
Land use:	Part vacant Crown land and Reserves, mostly cattle and sheep on pastoral leases (60%).

Mean Annual Flow (GL/year):	130
Estimated Divertible Yield (GL/year):	15

Water Quality:

Salinity:
Other significant parameters:

Existing Developments:

WC:
Other:
Current uses:

Possible future uses:

Possible water supply for the Port Hedland Scheme.

Factors (environmental, social and economic) which may affect future development:

1. The abandoned Talga Talga mining centre lies close to the dam site and there was a small lead mine to the west.
2. Sills of ultra basic rock of a type favourable for nickel deposits are known in the area.
3. The granting of mining tenements over some of these areas where they encroach on possible dam and reservoir sites has been a cause of concern in the past.

Comments:

The reliability of data for the mean annual flow and estimated divertible flow is poor.

Coongan River

Surface Water Source: Coongan River

River Basin: DeGrey **AWRC Basin No: 710**

Location: DS85 (Marble Bar)
7 653 400 m N, 781 500 m E

Catchment Details:

Area:	3800 km^2
Average rainfall:	250 - 350 mm/annum
Pan evaporation:	3700 mm/annum
Alienated:	60%
Cleared:	No significant clearing, but some overgrazing along valley plains.
Land use:	Part vacant Crown land and Reserves, mostly cattle and sheep on pastoral leases (60%).

Mean Annual Flow (GL/year):	110
Estimated Divertible Yield (GL/year):	26

Water Quality:

Salinity:	Fresh.
Other significant parameters:	Highly variable, improves at high flows.

Existing Developments:

WC:	None.
Other:	None.
Current uses:	None.

Possible future uses:

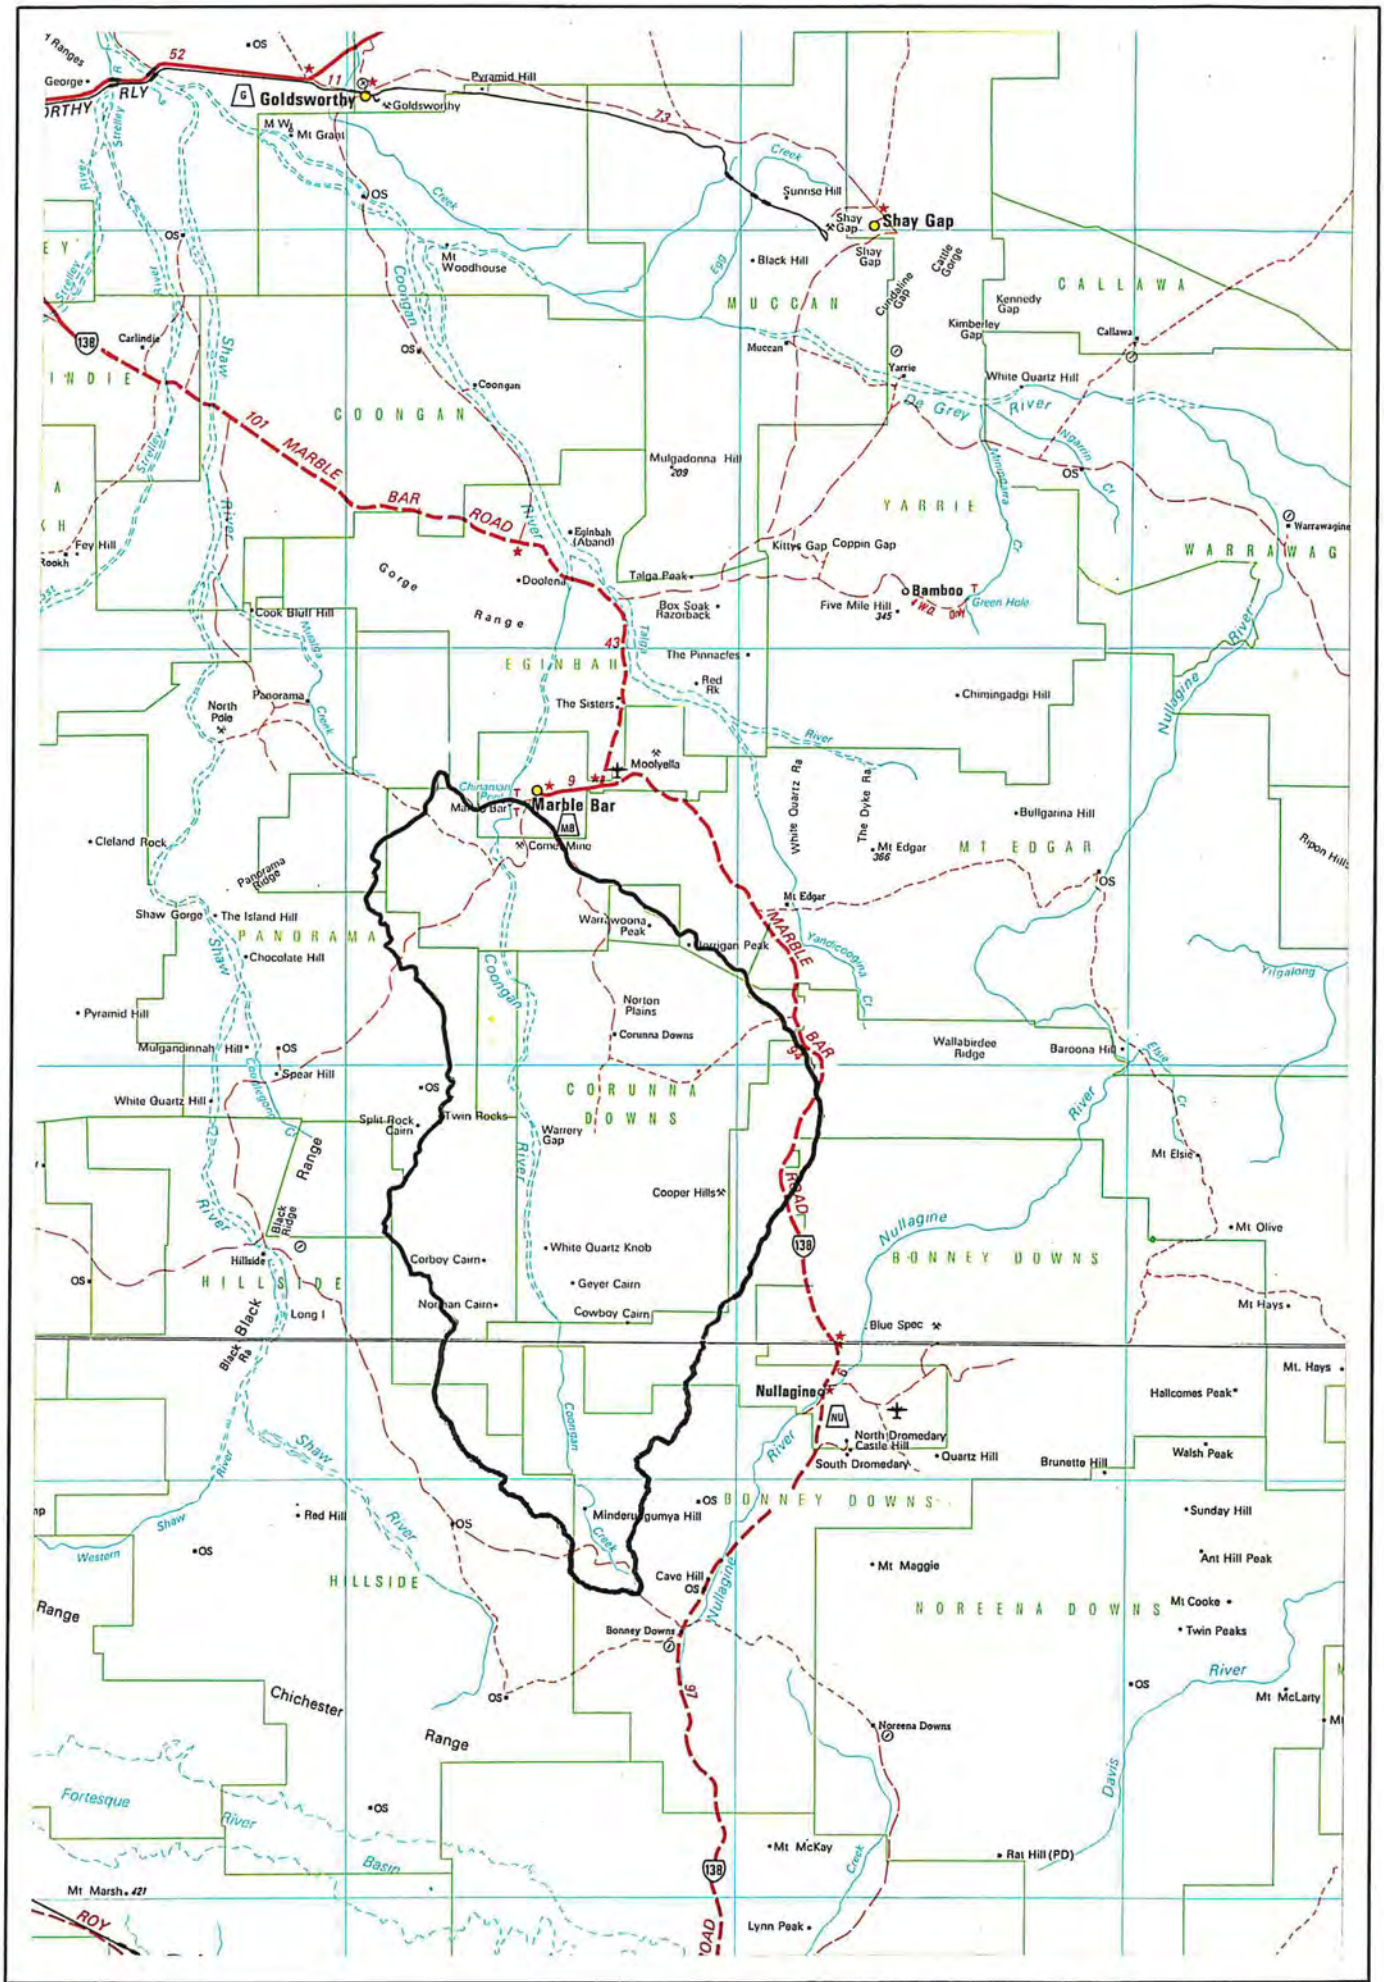
Possible water supply for the Port Hedland Scheme.

Factors (environmental, social and economic) which may affect future development:

1. A dam at Marble Bar would have some impact on mining in the area.
2. The jaspillite at the Marble Bar site is an important tourist attraction as well as being of scientific interest.

Comments:

The reliability of data on the mean annual flow and estimated divertible flow is poor. Treatment for turbidity may be required.



Coongan River

Surface Water Source:	DeGrey River

River Basin: DeGrey **AWRC Basin No: 710**

Location: DS158 (Yarrie Station)
7 709 000 m N, 214 000 m E

Catchment Details:

Area:	32 000 km^2
Average rainfall:	300 mm/annum
Pan evaporation:	3600 mm/annum
Alienated:	
Cleared:	
Land use:	

Mean Annual Flow (GL/year):	600
Estimated Divertible Yield (GL/year):	120 - 200

Water Quality:

Salinity:
Other significant parameters:

Existing Developments:

WC:	None.
Other:	None.
Current uses:	None.

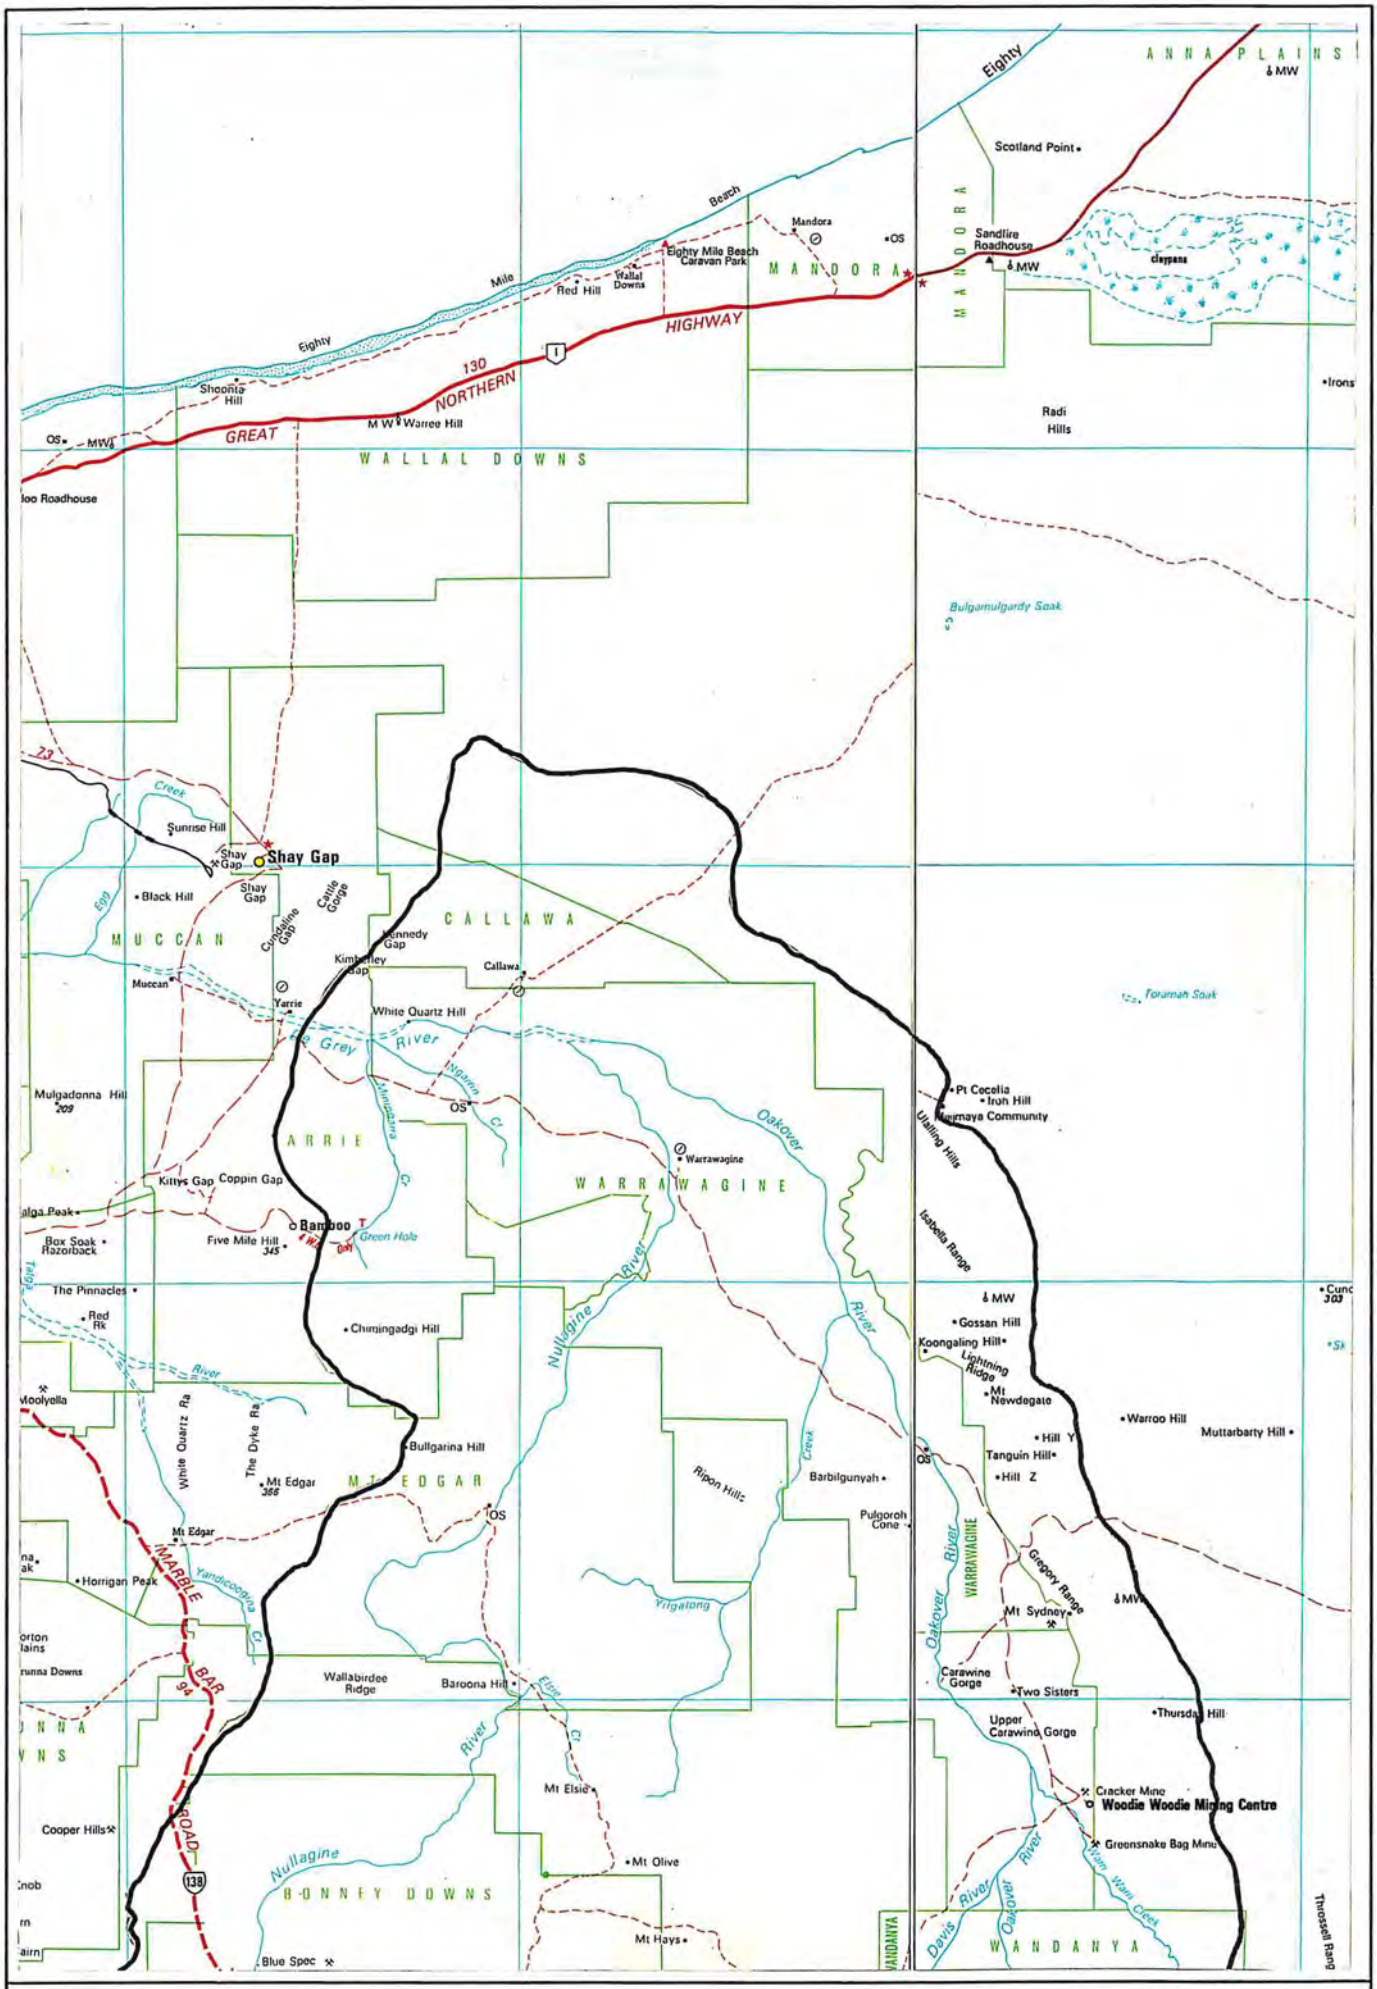
Possible future uses:

Possible water supply for the Port Hedland Scheme.

Factors (environmental, social and economic) which may affect future development:

Comments:

The reliability of data on the mean annual flow and estimated divertible flow is poor. Treatment for turbidity may be required.



De Grey River

Surface Water Source:	Oakover River

River Basin: DeGrey **AWRC Basin No: 710**

Location: DS102
7 619 500 m N, 299 000 m E

Catchment Details:

Area:	15 430 km^2
Average rainfall:	250 mm/annum
Pan evaporation:	3800 mm/annum
Alienated:	
Cleared:	
Land use:	

Mean Annual Flow (GL/year):	260
Estimated Divertible Yield (GL/year):	20 - 50

Water Quality:

Salinity:	Fresh.
Other significant parameters:	Turbidity high in high flow events.

Existing Developments:

WC:	None.
Other:	None.
Current uses:	None.

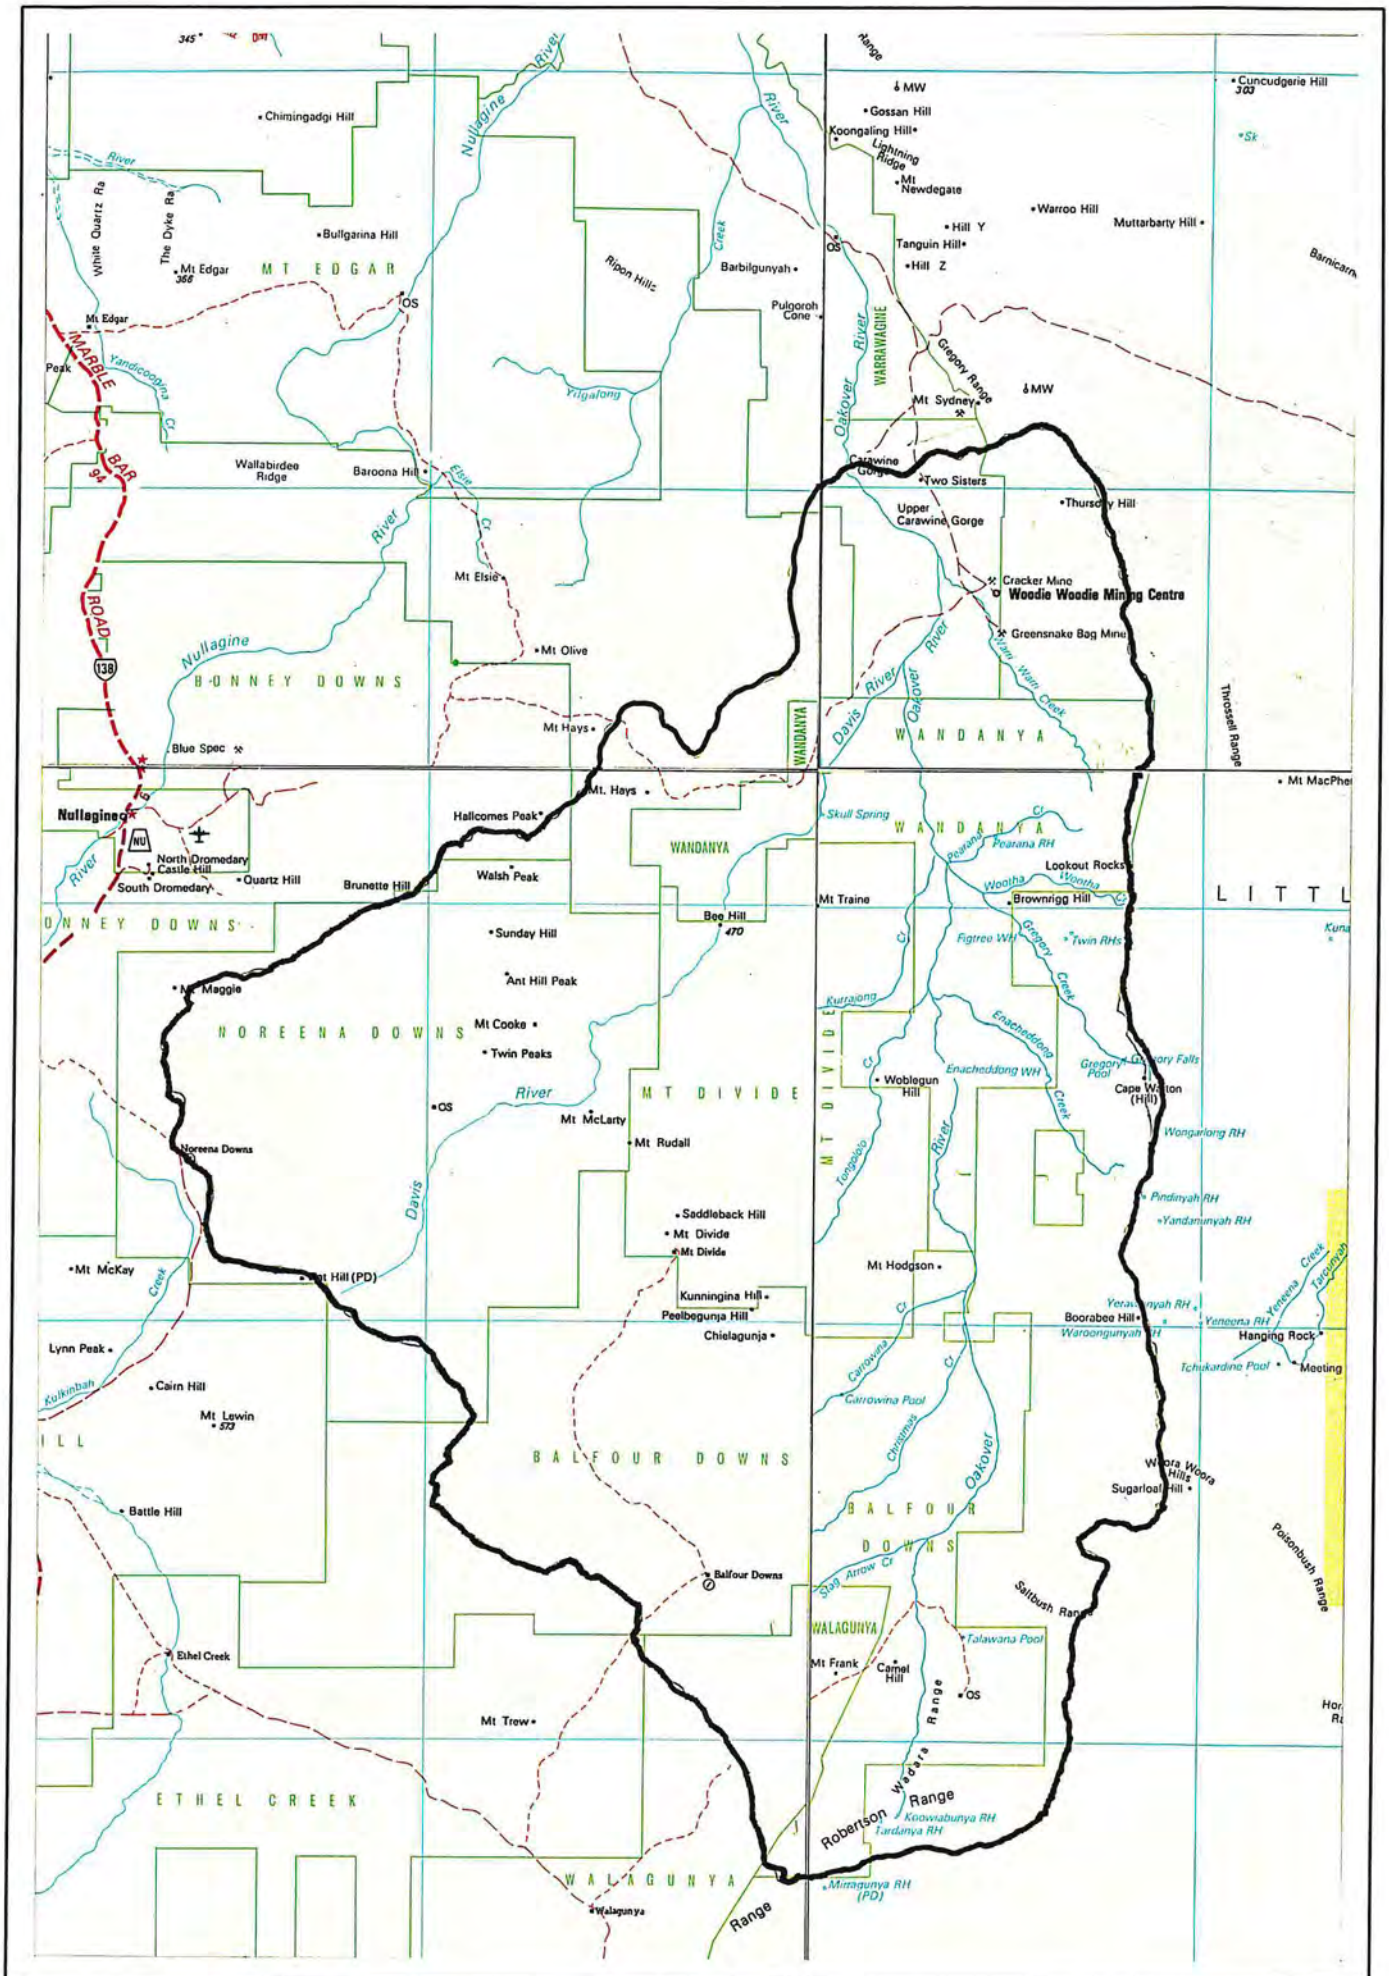
Possible future uses:

Possible water supply for the Port Hedland Scheme.

Factors (environmental, social and economic) which may affect future development:

Comments:

The reliability of data on the mean annual flow and estimated divertible flow is poor. Treatment for turbidity may be required.



Oakover River

Surface Water Source:	Oakover River

River Basin: DeGrey **AWRC Basin No: 710**

Location: DS145
7 586 300 m N, 305 300 m E

Catchment Details:

Area:	9280 km^2
Average rainfall:	250 mm/annum
Pan evaporation:	3800 mm/annum
Alienated:	
Cleared:	
Land use:	

Mean Annual Flow (GL/year):	120
Estimated Divertible Yield (GL/year):	5 - 25

Water Quality:

Salinity:	Fresh.
Other significant parameters:	Turbidity high in high flow events.

Existing Developments:

WC:	None.
Other:	None.
Current uses:	None.

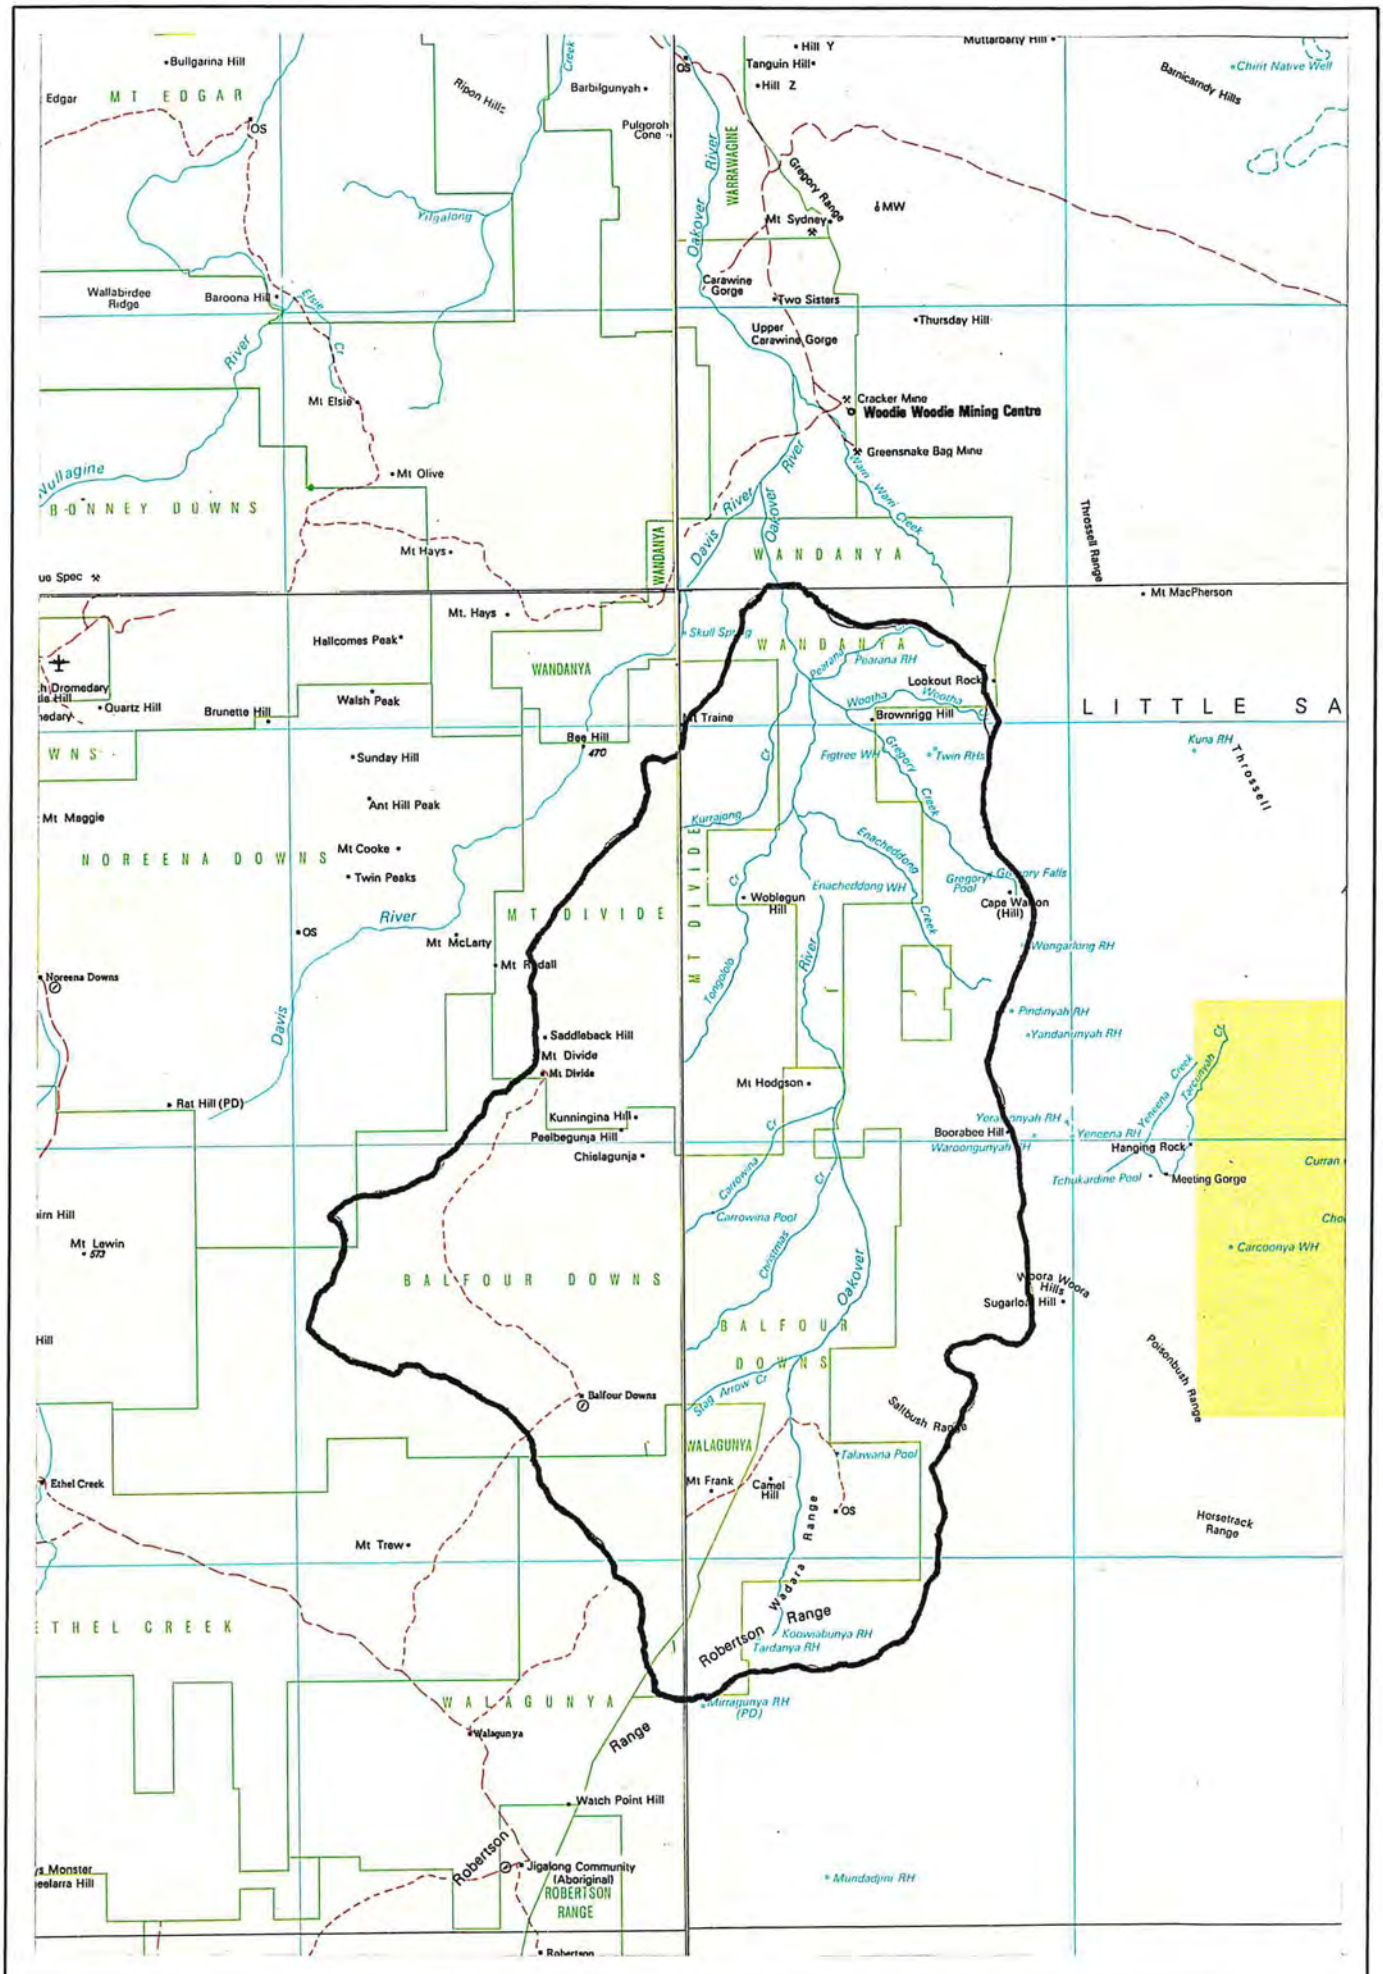
Possible future uses:

Possible water supply for the Port Hedland Scheme.

Factors (environmental, social and economic) which may affect future development:

Comments:

The reliability of data on the mean annual flow and estimated divertible flow is poor. Treatment for turbidity may be required.



Oakover River

Surface Water Source: Nullagine River

River Basin: DeGrey **AWRC Basin No: 710**

Location: DS40
7 678 200 m N, 256 100 m E

Catchment Details:

Area:	6425 km^2
Average rainfall:	250 - 300 mm/annum
Pan evaporation:	3600 - 3800 mm/annum
Alienated:	
Cleared:	
Land use:	

Mean Annual Flow (GL/year):	125
Estimated Divertible Yield (GL/year):	0 - 20

Water Quality:

Salinity:	Fresh.
Other significant parameters:	Highly variable, improves at high flows.

Existing Developments:

WC:	None.
Other:	None.
Current uses:	None.

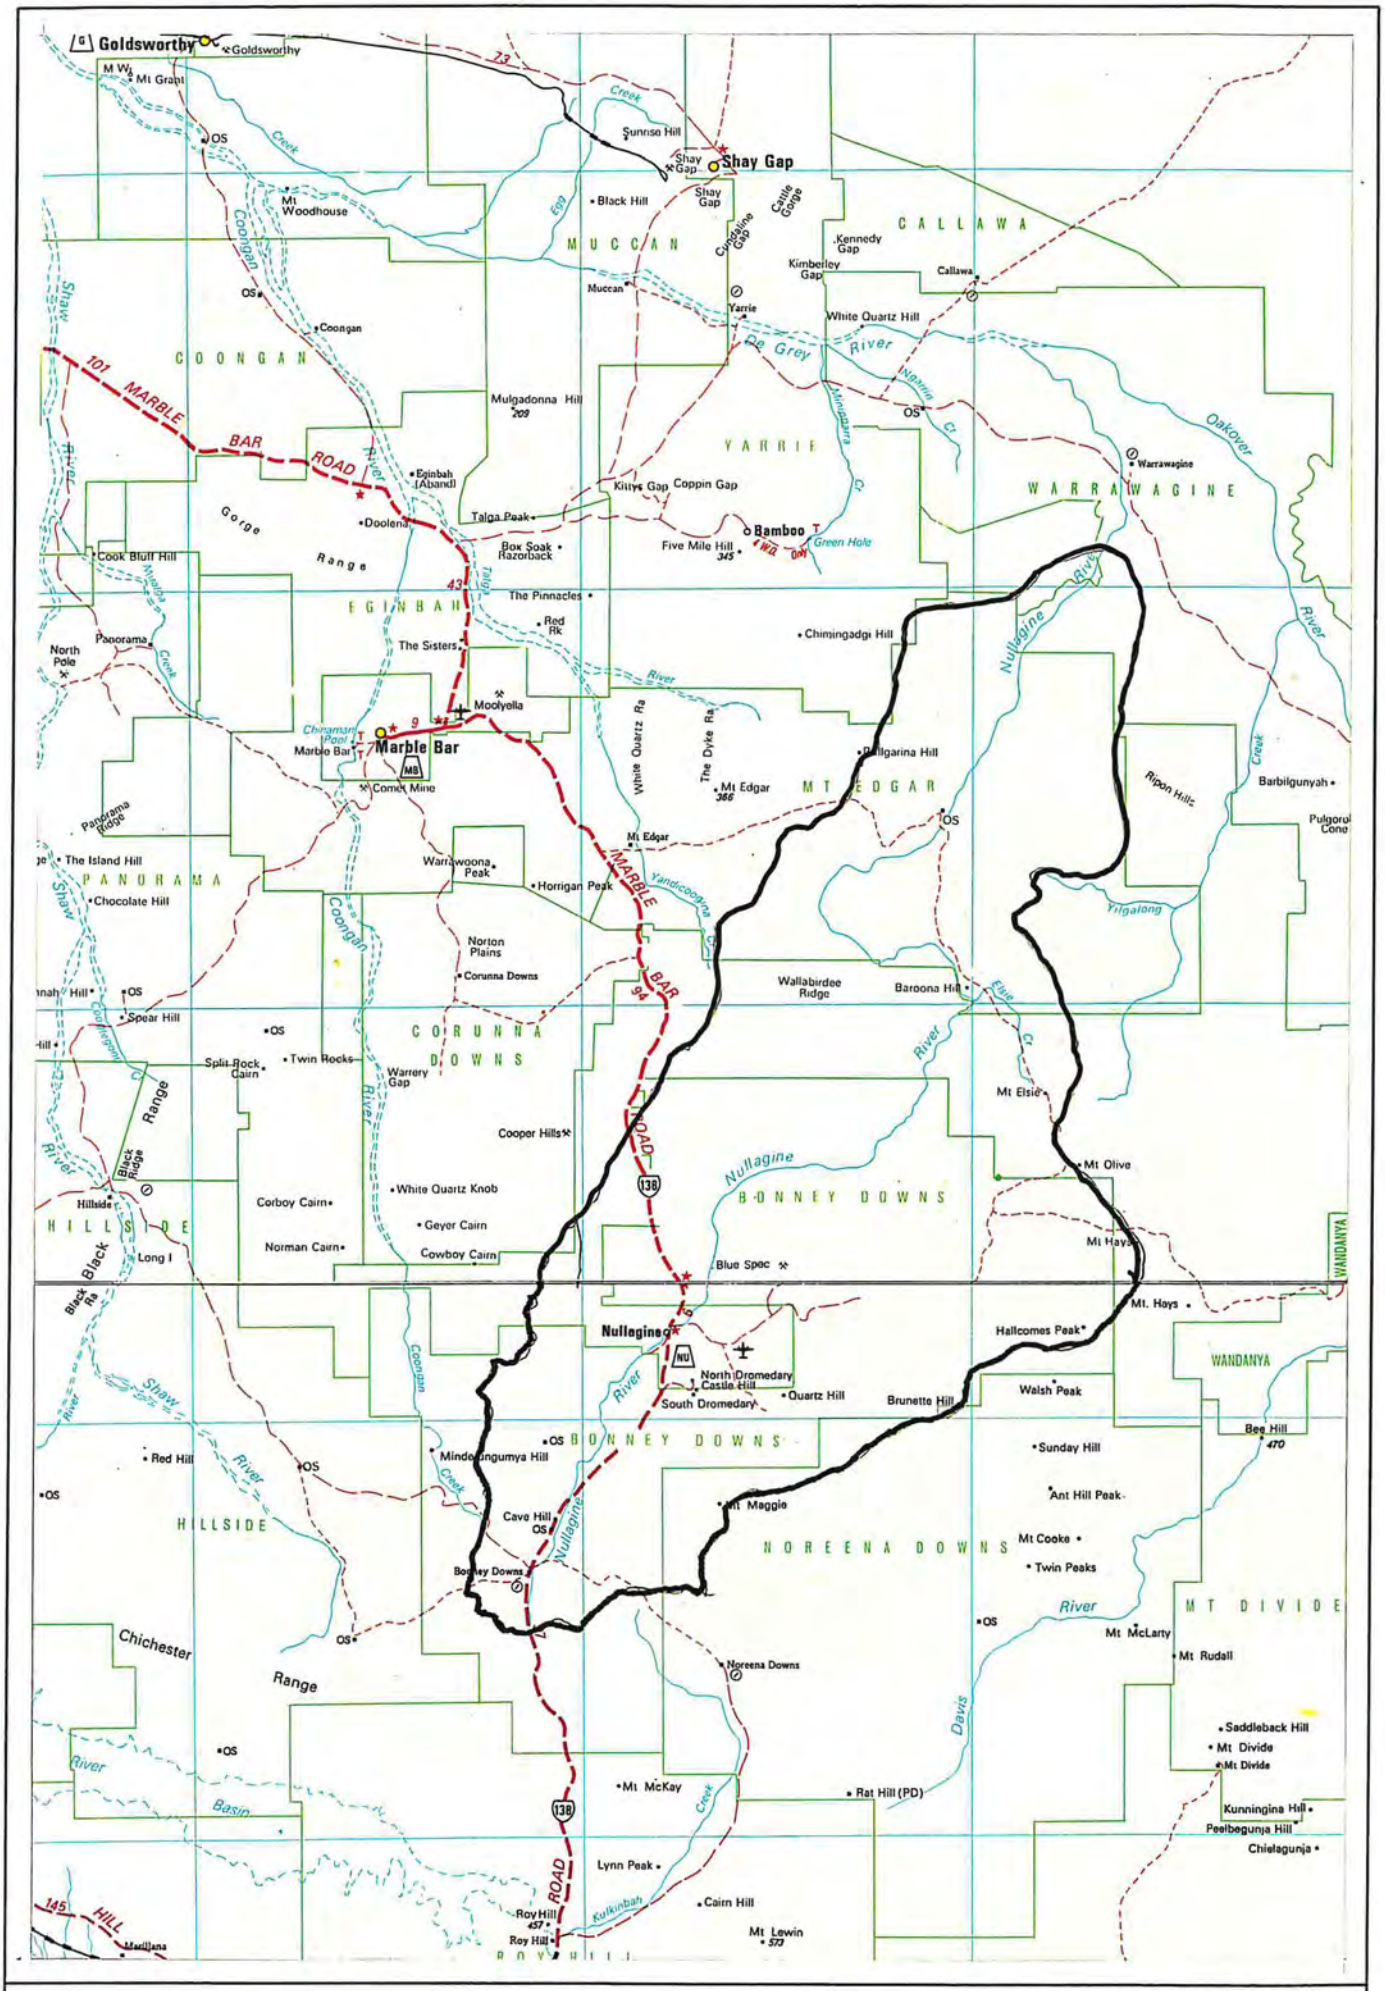
Possible future uses:

Possible water supply for the Port Hedland Scheme.

Factors (environmental, social and economic) which may affect future development:

Comments:

The reliability of data on the mean annual flow and estimated divertible flow is poor. Treatment for turbidity may be required.



Nullagine River

Surface Water Source: Nullagine River

River Basin: DeGrey **AWRC Basin No: 710**

Location: DS56
7 666 000 m N, 246 000 m E

Catchment Details:

Area:	5895 km^2
Average rainfall:	250 - 300 mm/annum
Pan evaporation:	3600 - 3800 mm/annum
Alienated:	
Cleared:	
Land use:	

Mean Annual Flow (GL/year):	115
Estimated Divertible Yield (GL/year):	25 - 40

Water Quality:

Salinity:	Fresh.
Other significant parameters:	Highly variable, improves at high flows.

Existing Developments:

WC:	None.
Other:	None.
Current uses:	None.

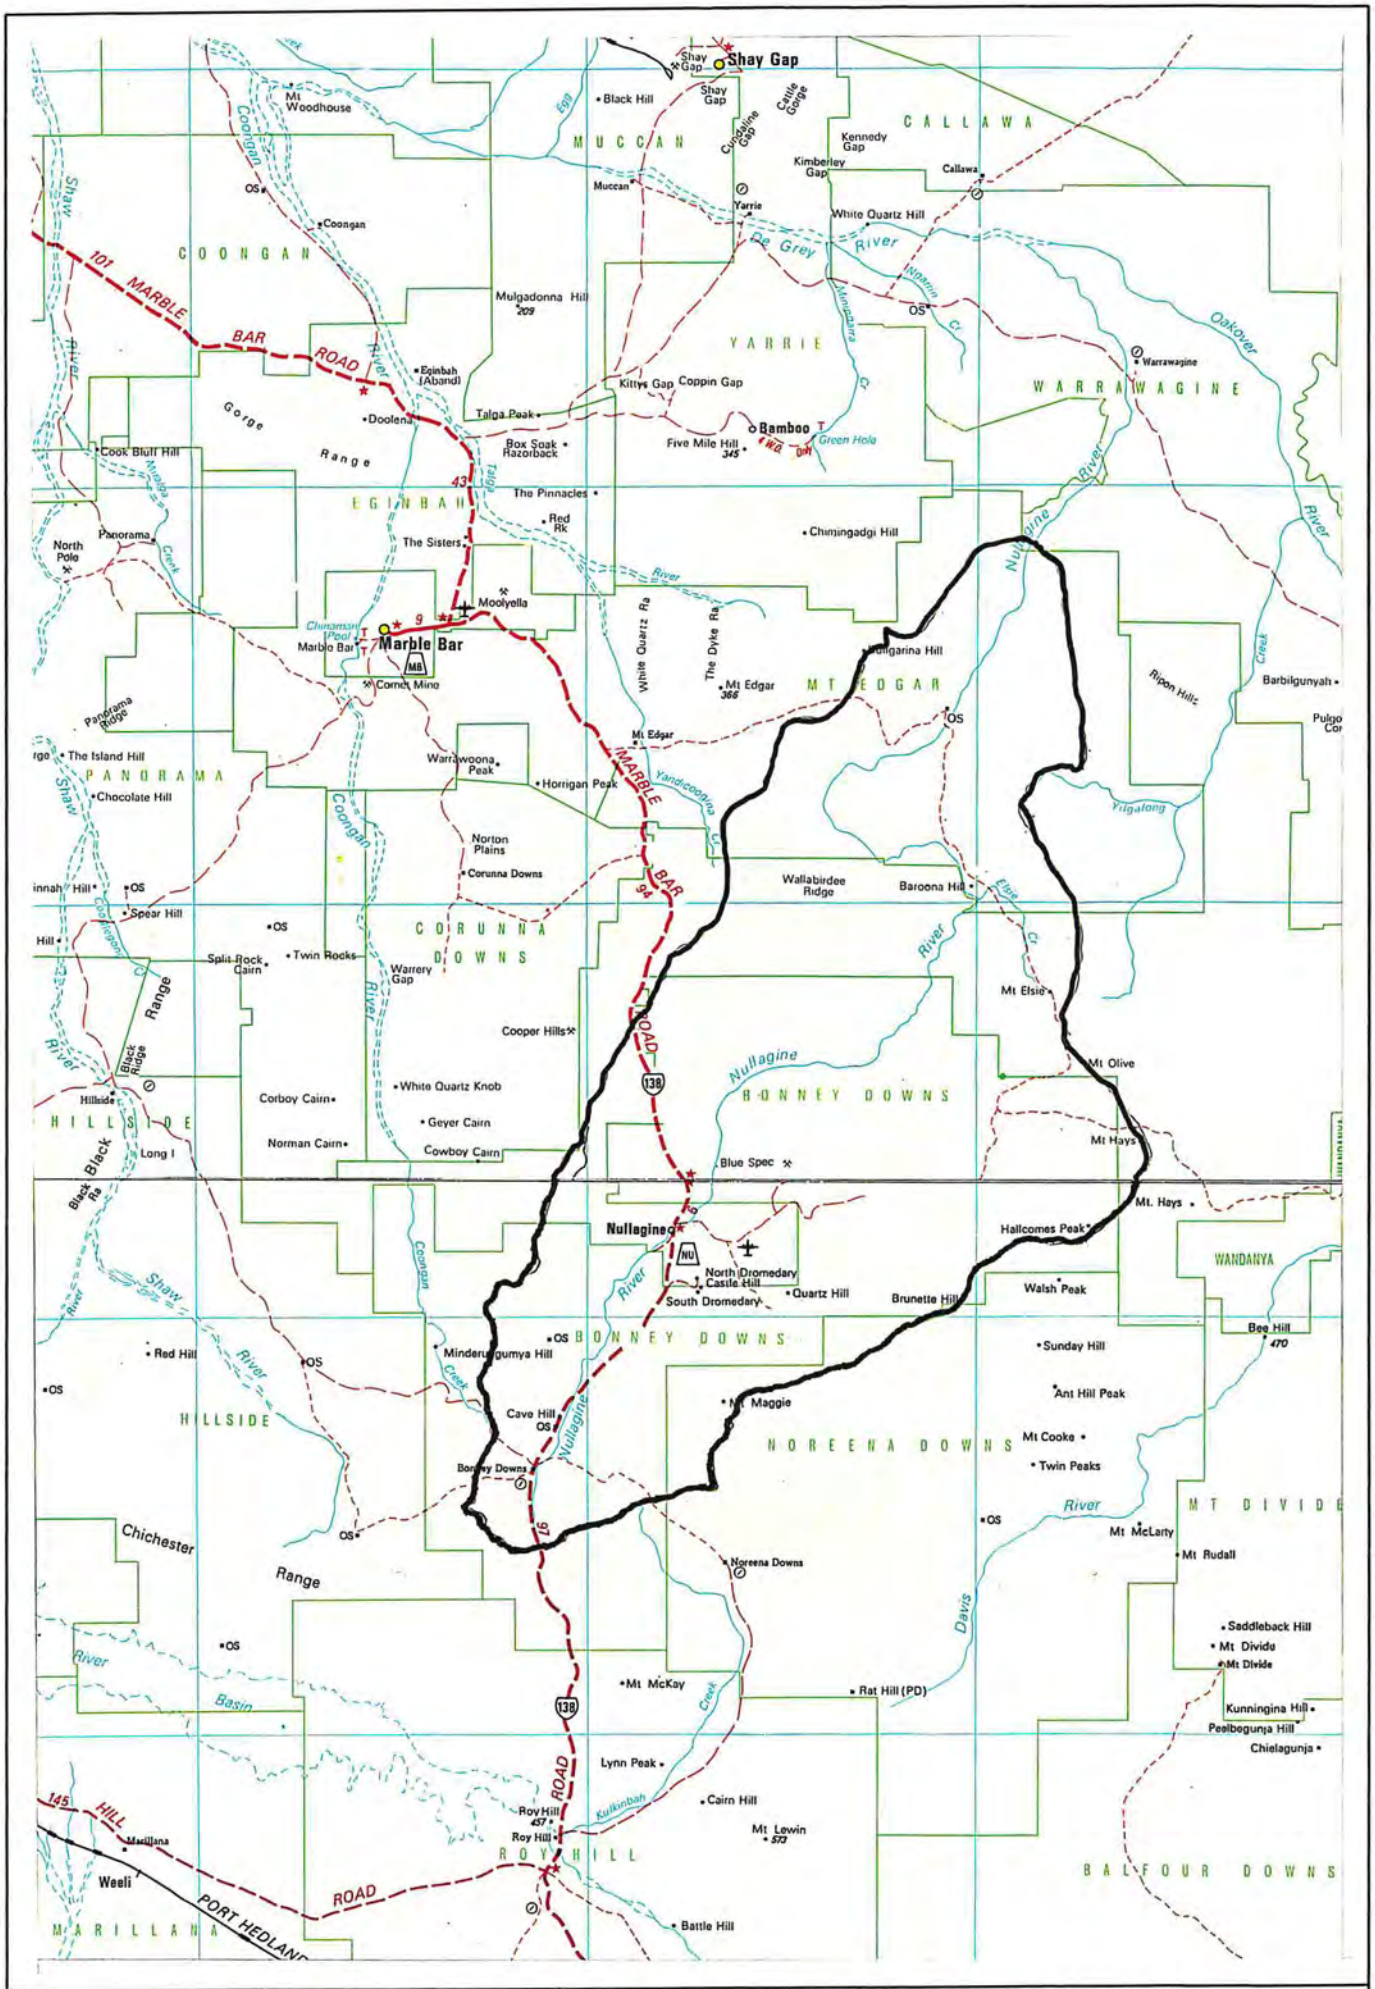
Possible future uses:

Possible water supply for the Port Hedland Scheme.

Factors (environmental, social and economic) which may affect future development:

Comments:

The reliability of data on the mean annual flow and estimated divertible flow is poor. Treatment for turbidity may be required.



Nullagine River

Surface Water Source: Nullagine River

River Basin: DeGrey **AWRC Basin No: 710**

Location: DS108
7 625 900 m N, 228 900 m E

Catchment Details:

Area:	4525 km^2
Average rainfall:	250 - 300 mm/annum
Pan evaporation:	3600 - 3800 mm/annum
Alienated:	
Cleared:	
Land use:	

Mean Annual Flow (GL/year):	90
Estimated Divertible Yield (GL/year):	20 - 35

Water Quality:

Salinity:	Fresh.
Other significant parameters:	Highly variable, improves at high flows.

Existing Developments:

WC:	None.
Other:	None.
Current uses:	None.

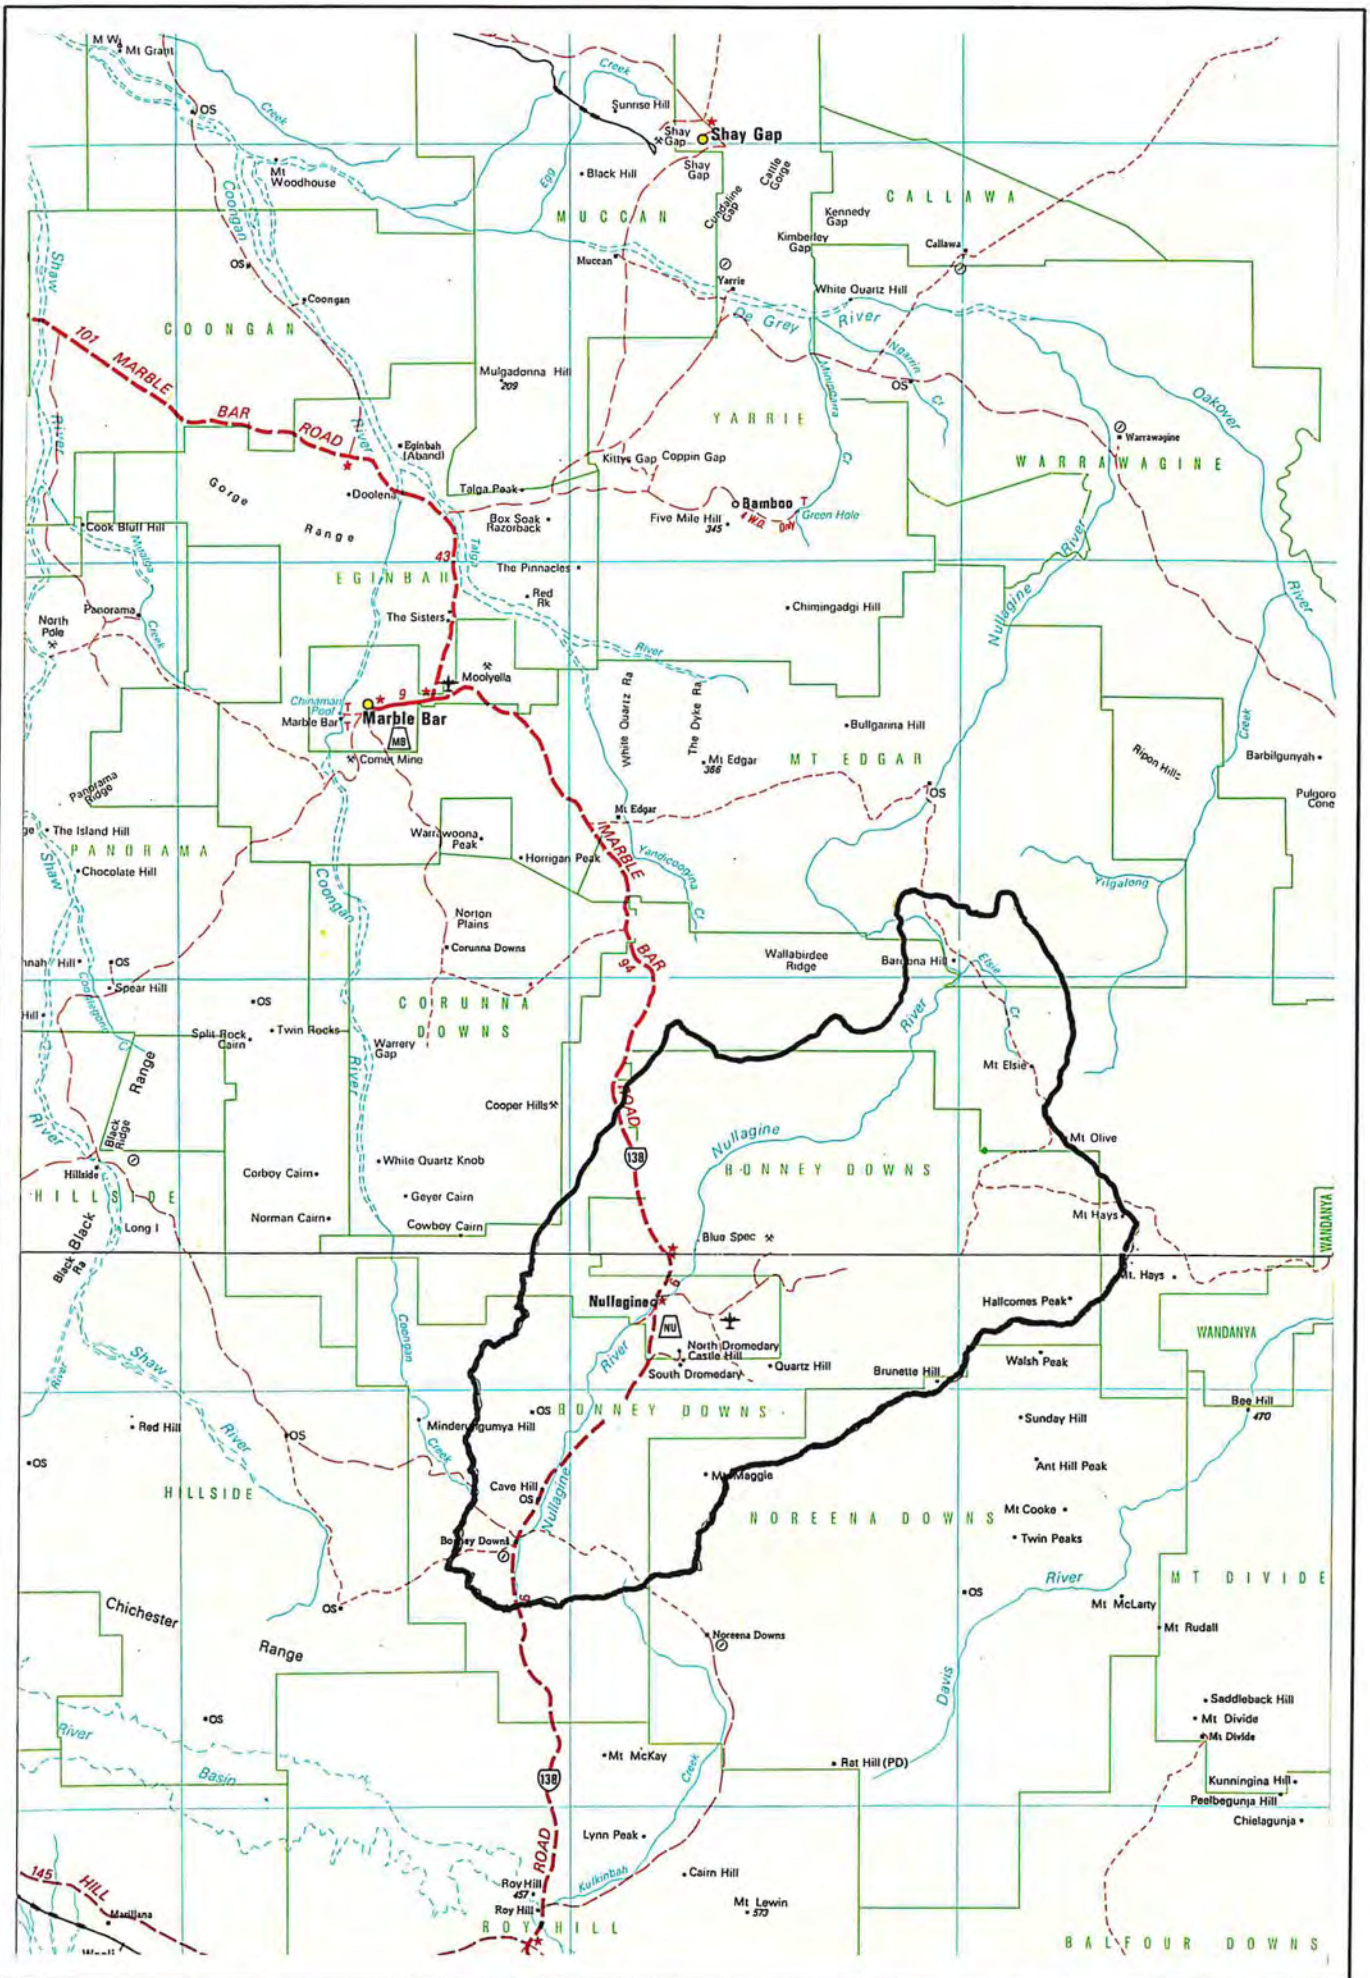
Possible future uses:

Factors (environmental, social and economic) which may affect future development:

Possible water supply for the Port Hedland Scheme.

Comments:

The reliability of data on the mean annual flow and estimated divertible flow is poor. Treatment for turbidity may be required.



Nullagine River

Surface Water Source: Nullagine River

River Basin: DeGrey **AWRC Basin No: 710**

Location: DS142
7 617 500 m N, 238 000 m E

Catchment Details:

Area:	4150 km^2
Average rainfall:	250 - 300 mm/annum
Pan evaporation:	3600 - 3800 mm/annum
Alienated:	
Cleared:	
Land use:	

Mean Annual Flow (GL/year):	80
Estimated Divertible Yield (GL/year):	15 - 30

Water Quality:

Salinity:	Fresh.
Other significant parameters:	Highly variable, improves at high flows.

Existing Developments:

WC:	None.
Other:	None.
Current uses:	None.

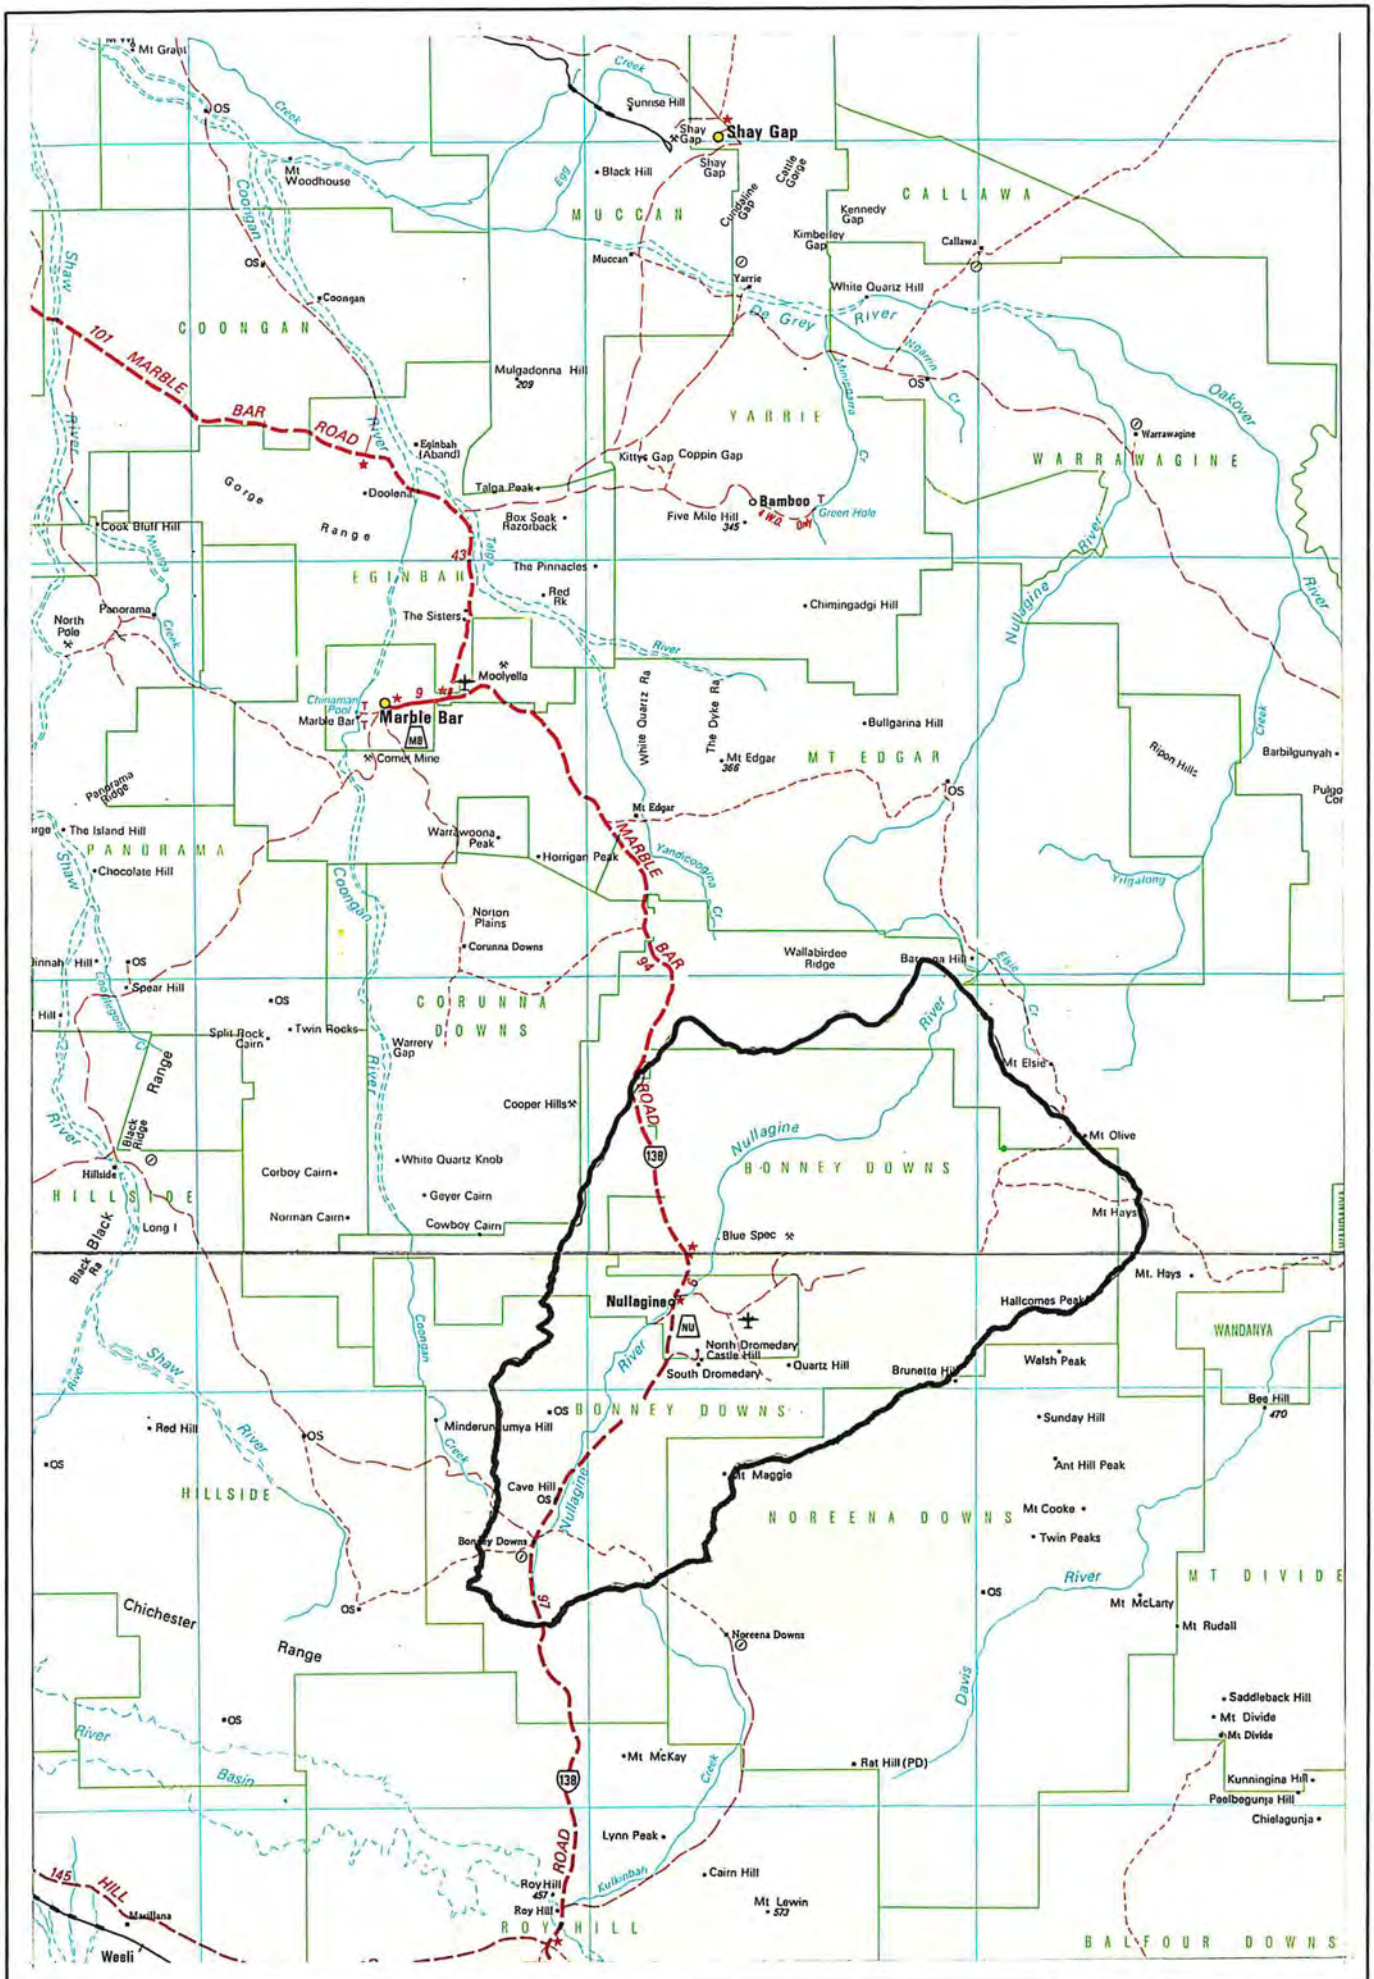
Possible future uses:

Possible water supply for the Port Hedland Scheme.

Factors (environmental, social and economic) which may affect future development:

Comments:

The reliability of data on the mean annual flow and estimated divertible flow is poor. Treatment for turbidity may be required.



Nullagine River

Appendix 4: Groundwater Resources

Groundwater Source:	Robe River

River Basin: Onslow Coast **AWRC Basin No: 707**

Location: **Lower Robe aquifer** - near the mouth of the Robe River

Aquifer Details:

Extent:	
Rock unit:	alluvium
Estimated Recharge:	
Estimated Yield:	10 GL/year
No of production wells:	6

Water Quality:

Salinity:	Fresh - salinity ranges between 400 - 800 mg/L.
Other significant parameters:	Highly variable, improves at high flows.

Possible future uses:

Possible water supply for West Pilbara development. The groundwater source could be used as part of a conjunctive use scheme.

Factors (environmental, social and economic) which may affect future development:

1. Environmental and social impacts are minimal if water is drawn sustainably.
2. No known Aboriginal sites in the vicinity of the proposed wellfield.

Investigations / Comments:

Groundwater Source: Kumina Creek

River Basin: Onslow Coast **AWRC Basin No: 707**

Location: **Kumina Creek aquifer**

Aquifer Details:

Extent:
Rock unit:
Estimated Recharge:
Estimated Yield: 1 GL/year
No of production wells: 13 (3 of which would be on standby)

Water Quality:

Salinity: Fresh.
Other significant parameters:

Possible future uses:

Possible water supply for West Pilbara development. The groundwater source could be used as part of a conjunctive use scheme.

Factors (environmental, social and economic) which may affect future development:

Located within mining leases. Low direct impact on the environment and on Aboriginal sacred sites.

Investigations / Comments:

For this quantity of water it is proposed that an engineering and economic assessment is not warranted.

Groundwater Source:	Fortescue River

River Basin: Fortescue River **AWRC Basin No: 708**

Location: **Lower Fortescue (Balmoral) aquifer**

Aquifer Details:

Extent:	200 km^2
Rock unit:	alluvial gravel
Estimated Recharge:	11 GL/year
Estimated Yield:	16 GL/year
No of production wells:	10
Wells Yield:	up to 800 kL/d

Water Quality:

Salinity:	Fresh - salinity range between 400 - 800 mg/L.
Other significant parameters:	

Possible future uses:

Possible water supply for West Pilbara development. The groundwater source could be used as part of a conjunctive use scheme.

Factors (environmental, social and economic) which may affect future development:

1. There are no known Aboriginal sites in the vicinity of the proposed wellfield.
2. It is probable that populations and foliage of species such as the Ghost Gum, Water Wood and perhaps the Snakewood Mulga, would be thinned by a drop in the watertable by 2 m.
3. Even without causing significant changes in vegetation, development of the borefield could affect the population of the Flock Pigeon, a species which does not readily adapt to human activity.
4. Potential for severe adverse impacts on the aquatic ecosystem of the Lower Fortescue borefield.

Investigations / Comments:

This data was obtained from exploratory drilling and test pumping of the alluvium carried out between 1983 and 1985. Development of a dam at Bullinnarwa, and to a lesser extent, Booyeemala, would have a significant impact on the recharge of the aquifer. It is possible the yield could drop by 50%. This requires further investigation.

Groundwater Source: Fortescue River

River Basin: Fortescue River **AWRC Basin No: 708**

Location: **Upper Fortescue aquifer**

Aquifer Details:

Extent:
Rock unit: Alluvial fans
Estimated Recharge:
Estimated Yield: 0 GL/year
No of production wells:

Water Quality:

Salinity: Fresh.
Other significant parameters:

Possible future uses:

Possible water supply for West Pilbara development. The groundwater source could be used as part of a conjunctive use scheme.

Factors (environmental, social and economic) which may affect future development:

1. Low direct impact on the environment and on Aboriginal sacred sites.
2. The only vegetation likely to be directly influenced by a lowered watertable would be the open woodland of River Gums on the shingle beds of the main tributary creeks.
3. The proposed wellfield is located within the same catchment area as Millstream. Hence abstracting water from the upper Fortescue aquifer could reduce the throughflow of water which ultimately naturally drains into the Millstream system.

Investigations / Comments:

From hydrogeological and environmental information, it would appear that the proposed Upper Fortescue wellfield is located within the same catchment area as Millstream. Abstracting water from the Upper Fortescue aquifer could reduce the throughflow of water which ultimately naturally drains into the Millstream system.

Groundwater Source: Maitland River

River Basin: Port Hedland Coast **AWRC Basin No: 709**

Location: **Maitland River Aquifer** - near Karratha Station

Aquifer Details:

Extent:	
Rock unit:	alluvium
Estimated Recharge:	
Estimated Yield:	3 - 5 GL/year
No of production wells:	6 (depending on investigative drilling)

Water Quality:

Salinity:
Other significant parameters:

Possible future uses:

Possible water supply for West Pilbara development. The groundwater source could be used as part of a conjunctive use scheme.

Factors (environmental, social and economic) which may affect future development:

1. Proposed investigation area is located within an Aboriginal Native Title Claim.
2. Close to some significant permanent pools used for tourism and recreation.

Investigations / Comments:

Investigative drilling is proposed to be undertaken in the near future by the Water Corporation. If a subsequent hydrogeological report indicates that there is sufficient water available, the Water Corporation will seek EPA approval for a borefield on the Maitland River.

Groundwater Source: West Canning Basin

River Basin: Sandy Desert **AWRC Basin No: 025**

Location: **West of Shay Gap**

Aquifer Details:

Extent:	
Rock unit:	sedimentary basin
Estimated Recharge:	
Estimated Yield:	15 - 50 GL/year
No of production wells:	

Water Quality:

Salinity:	Fresh.
Other significant parameters:	

Possible future uses:

Possible water supply for West Pilbara development. The groundwater source could be used as part of a conjunctive use scheme.

Factors (environmental, social and economic) which may affect future development:

Investigations / Comments:

* Known maximum yield in brackets.

(a) Average from 12 water supply bores is 9600 m^3/day (Masterson and Miotti, 1992).

(b) 12 x 10^6 m^3 of groundwater required for environmental support leaves 17 x 10^6 m^3 of recharge.

(c) Yield derived from bore in adjacent catchment but very close to Millstream.

Appendix 5: Environmental, Social, Cultural Values

Water Quality Protection

Inter-relationships between land use and water supply schemes

The development and operation of water sources involves 'using' land and water. Land is 'consumed' by inundation behind a reservoir, for roads, pipelines, well sites, treatment plants and other structures and earthworks. Water is diverted from streams or by the lowering of groundwater levels in the vicinity of wells. The construction and operation of water infrastructure may have other impacts such as those of dust, odour, vibration and noise. These impacts occur on both the natural environment and the social environment.

The following tables indicate the types of impacts that developments of water resources for public supply have on land use and conversely the impacts that land use has on water sources. This broad assessment is made for surface water and shallow groundwater and for forested, rural and urban land uses.

The tables describe:

Table	Description
A5.1	Impacts of forest land use on surface water resources.
A5.2	Impacts of surface water schemes on forest land use.
A5.3	Impacts of rural and urban land use on surface water resources.
A5.4	Impacts of surface water schemes on rural and urban land use.
A5.5	Impacts of land use on shallow groundwater resources.
A5.6	Impacts of shallow groundwater schemes on land use.

Confined aquifer wells have very little impact on land uses in their vicinity because they occupy a very small area of land and are not affected by, nor do they affect, nearby surface uses of the land. However, an operating well creates a local area of low pressure in the confined groundwater. Any other confined well within this area of low pressure will experience reduced pumping efficiency.

Note that one of the key impacts described in the tables is that of land use on the quality of water resources.

Table A5. 1: Impacts of forest land use on surface water resources.

	CONSERVATION RESERVES	TIMBER PRODUCTION	MINOR FOREST PRODUCTS (Beekeeping, charcoal, firewood, gravel)	MINING	SERVICE CORRIDORS	RECREATION	CONSERVATION OF ECOSYSTEMS
FLOW Volume (yield)	High density forest has low yield.	Higher yield from forest with reduced density from logging.	As for timber production except less intense.	Some increase in yield during mining; possible reduction after rehabilitation if vegetation very dense.	Negligible effects.	Negligible effects.	Possible reduction of water for water supply due to ecosystem maintenance.
SALINITY	Streams in conservation reserves usually fresh.	If logging spreads dieback and/or forest density is reduced, stream salinity may increase in lower rainfall areas.	As for timber production except less intense.	No risk in high rainfall areas. Risk in lower rainfall areas is being determined.	May have indirect effects in low rainfall areas through spread of dieback.	As for service corridors.	May help prevent activities which risk salinity increases.
TURBIDITY	Minimal.	Careful management needed to avoid turbidity from logging areas.	As for timber production except less intense.	Management required to avoid turbid runoff from pits and haul roads.	A serious source of turbidity.	Recreation causes little turbidity.	Nil.
CHEMICAL POLLUTION	Nil.	Minimal (chemical spills).	As for timber production except less intense.	Minor risk of fuel spills. Leachate from tailings.	Risk of transport of hazardous chemicals in catchments.	Low (litter, nutrients).	Nil.
BIOLOGICAL POLLUTION	Minimal (illegal entry)	Minimal (operators)	As for timber production except less intense.	Minimal (operators)	High risk where roads encourage human access to streams.	High risk where camping is popular and close to water.	Nil.

Table A5. 3: Impacts of rural and urban land use on surface water resources.

	PASTURE	CROPS	HORTICULTURE	RURAL INDUSTRY (e.g. abattoir, refineries)	INTENSIVE ANIMAL HUSBANDRY	SPECIAL RURAL (Hobby farms)	URBAN
FLOW VOLUME (yield)	Large yield increase compared to forested area. Irrigation may increase or reduce yield depending upon source of water.	As for pasture.	As for pasture.	Demand for industrial water supply may reduce flow.	Minor reduction in yield if water supply required.	As for intensive animal husbandry.	Increased runoff from road, and roofs, but not usually significant because urban areas are usually only a small fraction of catchment.
SALINITY FROM GROUNDWATER DISCHARGE	Clearing may cause brackish or saline streams after clearing in lower rainfall, higher soil-salt storage areas.	As for pasture.	Not usually in salinity - risk areas.	N/A	N/A	As for pasture.	N/a
TURBIDITY	High risk of turbidity if animals have direct access to stream.	High risk of turbid runoff from ploughed fields.	As for crops.	Poor management of site or process can cause severe turbidity.	Turbidity is only a risk in some cases of poor management.	Low risk of turbidity, except when there is a large number of different land owners.	Runoff from roads and verges can cause turbidity.
CHEMICAL POLLUTION	Risk of pollution from agricultural chemicals, pesticides and fertilisers.	As for pasture.	High risk of pollution from pesticides and fertilisers if their application is not controlled.	Harmful chemicals may be discharged to stream if pollution is not controlled.	Risk of pollution from high nutrient loads in effluent and runoff from site unless adequately managed.	As for pasture.	Risk of pollution from urban runoff which contains rubber, fuel and oil, spillage of poisons; drainage from rubbish disposal sites.
BIOLOGICAL POLLUTION	Risk from human and stock access to stream or reservoir.	Minimal.	Usually higher density of human habitation then crops or pasture hence higher risk.	Highly polluting effluent should be treated to acceptable standard before discharge to stream or preferably removed from catchment.	High risk if effluent not adequately treated or removed from catchment.	Relatively high density of housing using septic systems increases risk of pollution of streams. Generally higher level of human activity near streams produces significant pollution.	Disposal of sewage can present a risk of pollution. High concentration of people increases risk of people increases risk of pollution from human contact with stream water or impounded water.

Table A5. 2: Impacts of surface water schemes on forest land use.

	CONSERVATION RESERVES	TIMBER PRODUCTION	MINOR FOREST PRODUCTS (Beekeeping, charcoal, firewood, gravel)	MINING	SERVICE CORRIDORS	RECREATION	CONSERVATION OF ECOSYSTEMS
Catchment areas	Priority for conservation does not prevent use as a catchment	Imposes costs of careful management	As for timber production	Imposes costs of careful management	Prefer routes away from streamlines	May constrain particular activities in particular areas	Recognition of catchment areas has limited the clearing of native forests for agriculture.
STORAGE DAMS a) Impacts of dam and reservoir basin	Storage dams cannot be located in conservation reserves	Some loss of timber growing land in the reservoir basin, which is likely to be above average quality, due to richer soils in valley floors.	As for timber production	Some mineral may be lost under water. Dam and reservoir may constrain routes of haul roads and conveyors.	May constrain routes.	Adds tourist attraction, but active water pastimes may be restricted. Reduces lengths of wild rivers by inundation.	The total area of Murray type landform is proportionately most reduced by reservoirs, compared to other landforms.
b) Downstream impacts	Flow quantity and variation is reduced.	Nil	Nil	Nil	Nil	Flow regulation may improve value of river downstream for recreation.	Flow quantity and variation is reduced.
PIPEHEAD DAMS	Although incompatible at site of works, small size makes a compromise easier if these is a conflict.	Negligible.	As for timber production.	No impact except for especially careful management in vicinity of pipehead.	Negligible	Access usually restricted. Little impact on recreational value of downstream flows.	Creates long-lasting pool in river where previously there was only occasional flooding.
PIPELINES	Similar to roads and powerlines.	Similar to roads and powerlines.	As for timber production.	Constrain routes for haul roads.	Slightly higher costs at intersections of pipes with other services.	May be visually intrusive in landscape. May improve walking access to forest.	Similar to roads and powerlines.

Table A5. 4: Impacts of surface water schemed on rural and urban land use.

	PASTURE	CROPS	HORTICULTURE	RURAL INDUSTRY (e.g. abattoir, refineries)	INTENSIVE ANIMAL HUSBANDRY	SPECIAL RURAL (Hobby farms)	URBAN
Catchment areas	No impact on conservative farming practices. Potential for rezoning to more densely inhabited or industrial land use may be restricted.	As for pasture.	As for pasture.	Imposes cost of careful management. Industry producing toxic wastes should be excluded from catchment.	Imposes cost of careful management and possible relocation if near stream.	As for pasture and urban. Control on location of septic tanks.	Possibly extra costs for sewage and rubbish disposal. Need to keep urban development away from streams.
STORAGE DAMS a) Impacts of dam and reservoir basin	Private land would need to be resumed in reservoir basin and dam works area.	As for pasture.	As for pasture.	As for pasture.	As for pasture.	As for pasture.	As for pasture.
b) Downstream impacts	Flows greater than required for riparian rights are markedly reduced. Flooding is reduced.	As for pasture.	As for pasture.	As for pasture. If industries have used stream for water supply, special arrangements for continued use may be required.	As for pasture.	As for pasture.	As for pasture.
PIPEHEAD DAMS	As for storage dam except that required land area is very much smaller.	As for pasture.	As for pasture.	As for storage dam except that impact on downstream flows is less.	As for pasture.	As for pasture.	As for pasture.
PIPELINES	Easement required on pipeline route. Above ground pipe can give problems of access and slight loss of productive land. Below ground pipe has minimal impact.	As for pasture.	As for pasture.	Pipe route would probably avoid industrial site.	As for special rural.	As for pasture, except pipe route would probably avoid private land.	If pipeline must pass through urban land, there may be difficulty fitting in with other services.

Table A5. 5: Impacts of land use on shallow groundwater resources.

	NATURAL VEGETATION	WETLANDS	PINE FOREST	MARKET GARDEN HORTICULTURE SPECIAL RURAL	URBAN	RURAL INDUSTRY	INTENSIVE ANIMAL HUSBANDRY
VOLUME AVAILABLE YEARLY	May be limited by need to maintain native vegetation except where the depth to groundwater is sufficiently deep.	May be limited by need to maintain wetlands.	For about 10 years after clearing to plant pines, there is increased recharge. As trees grow older there is less recharge than with native vegetation.	Water available for public supply is reduced by most of the amount withdrawn for irrigation (remainder soaks back to the water table).	Increased runoff from roads and roofs increases recharge, but stormwater drainage may divert some flow away from recharging groundwater.	Water available for public supply reduced by amount drawn from groundwater by industry.	As for market gardens.
POLLUTION	No impact.	No impact unless wetlands receive drainage from urban, industrial or market garden areas.	No impact unless there is inappropriate use of chemicals.	Groundwater pollution by pesticides, fertilisers, effluent from septic tanks.	Groundwater pollution by pesticides, fertilisers, waste and leaked petroleum. Drainage from rubbish disposal sites, effluent from septic tanks.	Groundwater pollution specific to the industry may occur through waste disposal.	Groundwater pollution by effluent from treatment of wastes.

Table A5. 6: Impacts of shallow groundwater schemes on land use

	NATURAL VEGETATION	WETLANDS	PINE FOREST	MARKET GARDEN HORTICULTURE SPECIAL RURAL	URBAN	RURAL INDUSTRY	INTENSIVE ANIMAL HUSBANDRY
UNDERGROUND WATER POLLUTION CONTROL AREAS, GROUNDWATER AREAS, PUBLIC WATER SUPPLY AREAS	No impact.	Conservation value is maintained through management plans.	Plantation management may be modified to give priority to water production.	Licensing of private wells raises the awareness of the limited availability of the water resource and encourages efficient use. Management is required to prevent pollution of groundwater.	Private wells are licensed and care is taken by public authorities in siting of waste disposal and industry. Management is required to prevent pollution of groundwater.	Water Authority generally objects to industry with potential for groundwater pollution being sited in these areas. Other industries as for market gardens.	As for rural industry.
WELLS	Tree deaths may occur near wells in droughts. Yearly groundwater production plans are designed to limit this occurrence. 200 sq. m of land is required for works at well site.	Locations of wells chosen and wells operated to minimise effects on wetlands.	Viability of pines not affected by groundwater level. 200 sq. m of land is required for works at well site.	Lowers the water table in immediate vicinity. Where wells are situated close together, they may need to be deeper than if further apart. Allocation policy and management are required.	Sites for wells are usually found on public land where their impact is similar to other service installations.	Wells should not be sited in the vicinity of an industry with potential for pollution. Other industry as for market gardens.	As for rural industry.
COLLECTOR MAINS	Mains are generally buried but access is required along route. Existing roads used wherever possible.	Mains are not located in wetlands.	As for natural vegetation.	An easement is required if mains must be located on private land. Impact of main on land use is minimal.	Routes for collector mains must be found in road reserves as for other services.	Routes for mains would avoid conflict with requirements of industry.	As for rural industry.
GROUNDWATER TREATMENT PLANTS	Approx. 6 ha site required for treatment works and disposal of sludge.	N/A	As for natural vegetation.	N/A	Works would be visually obtrusive, and may be source of odour and noise for adjacent houses. Buffer zone required.	N/A	N/A

Overview of Water Source Protection Policies (DRAFT)

The Water and Rivers Commission is responsible for managing and protecting Western Australia's water resources. The Commission has developed policies for the protection of public drinking water source areas, including the draft policy: ***"Protection of Groundwater Resources Used for Drinking Water Supplies in Country Areas of Western Australia"***. This policy defines three levels of priority classification for the protection of groundwater resources.

Priority 1 (P1) source protection areas are defined to ensure that there is no degradation of the water source. P1 areas are declared over land where the provision of the highest quality public drinking water is the prime beneficial land use. P1 areas would typically include land under Crown ownership. Development is generally not permitted in P1 areas.

Priority 2 (P2) source protection areas are defined to ensure that there is no increased risk of pollution to the water source. P2 areas are declared over land where low intensity development (such as rural) already exists. Provision of public water supply is a high priority in these areas. Some development is allowed under specific guidelines.

Priority 3 (P3) source protection areas are defined to minimise the risk of pollution to the water source. P3 areas are declared over land where water supply needs co-exist with other land uses such as residential, commercial and light industrial developments. Protection of P3 areas is achieved through management guidelines rather than restrictions on land use. If the water source does become contaminated, then water may need to be treated or an alternative water source be found.

In addition to priority classification, **wellhead protection zones** are defined to protect the aquifer from contamination in the immediate vicinity of production wells. Wellhead protection zones are usually circular, with a radius of 500 metres in P1 areas and 300 metres in P2 and P3 areas. These zones do not extend outside water reserves. Restrictions apply to storage of fuels, solvents, oils and pesticides within these zones.

Table A5.7: Acceptable, Restricted and Unacceptable Land Uses (DRAFT)

This table is to be used as a guideline only. The Water and Rivers Commission should be consulted regarding any developments or changes of land use within Public Drinking Water Source Areas.
Information relating to land use and developments which are not listed in the table can be obtained from the Water and Rivers Commission.

Definitions

Acceptable	The development/land use is compatible with the management objectives of the priority classification
Unacceptable	The development/land use is incompatible with the management objectives of the priority classification
Restricted	The development/land use may be compatible with the management objectives of the priority classification with appropriate site management practices *Restricted activities should be referred to the Commission for assessment on a case specific basis*

Appendix 7: Water Entitlement Agreements

Table A7. 1: West Pilbara Scheme - Water Entitlements

Table A7. 2: East Pilbara Scheme - Water Entitlements

Current Water Entitlement Agreements

During the late 1960's and 1970's several agreements with the large companies operating in the Pilbara were entered into with the State. These agreements entitled the companies to an agreed quantity of water, either on a daily or annual basis. The agreed quantity of water to be supplied to the companies, in all cases, was for domestic as well as industrial purposes. These agreements apply to both the West Pilbara Water Supply Scheme and the Port Hedland Scheme.

West Pilbara

Hamersley Iron Pty Ltd

This agreement was made on the 10/11/69. The agreement with Hamersley is for the Water Corporation to supply 13 640 kL/d to the Karratha and Dampier areas. In a letter dated 19 November 1969, Hamersley Iron agree that the quota is to supply industrial, domestic and domestic needs of a consequential growth up to 5%. Hamersley have an additional entitlement of 9090 kL/d from Millstream to the Yannery Tank. In a letter dated 11 December 1970, Hamersley Iron in paragraphs 3 & 4 refer to the possibility of developing alternative sources and restrictions respectively.

Robe River

This agreement was made on the 13/7/76. The agreement with Robe River is for the Water Corporation to supply 11 820 kL/d to the Cape Lambert and Wickham areas. Robe Rivers' entitlement can be increased to 18 185 kL/d subject to Robe meeting the deferred capital expenditure on works, provided in the agreement. Clause B of the agreement refers to water supplied for both industrial and domestic use and Clause H, paragraphs 12 & 13, refer to restrictions and alternative sources respectively.

Woodside Offshore Petroleum Pty Ltd

This agreement was made on the 16/8/79. The agreement with Woodside is for the Water Corporation to supply 4225 kL/d to the Karratha and Burrup Peninsula areas for domestic and industrial purposes (refer to clause 18 (1)). However in 1985 Woodside submitted a variation to the agreement which stated that their revised water requirement was 3172 kL/d. The Water Corporation have indicated that this is the figure that they are working on, although Financial Planning suggest that since it appears that Woodside has paid for an allocation of 4225 kL/d then that should be their entitlement.

East Pilbara

BHP - Mount Newman Mining Company

The most recent agreement with BHP - Mount Newman is for the Water Corporation to supply 24 909 kL/d to a maximum of 5 680 000 kL in any financial year. This agreement was made in October 1977. The letter sent by the Minister for Industrial Development on 24 September 1977 referred to industrial and domestic water requirements and restrictions in paragraphs (d) & (g) respectively.

BHP - Goldsworthy

The agreement with BHP - Goldsworthy is for the Water Corporation to supply 2100 kL/d to Finucane Island. This agreement was made on the 5/8/86.

Percentage of Entitlement Used

The quantity of water consumed for industrial purposes, can, and is metered by the Water Corporation. However, the quantity of water used for domestic purposes by each of the companies is very difficult to measure, further complicated by the fact that some of the companies are selling their houses to their employees. The quantity of water used for domestic purposes has been estimated from the number of accommodation units. The quantity of water estimated to have been used by the companies is shown in Table A7. 1 and Table A7. 2. It would appear that current usage is just under 50% of their combined entitlement.

In Port Hedland BHP - Goldsworthy are relocating employees who were living in 50 houses on Finucane Island to the mainland. This could have implications on BHP - Goldsworthy's entitlement at Finucane Island. This issue is currently being considered by Financial Planning Branch.

What percentage of each companies entitlement is used, needs to be closely monitored, to ensure that as demand increases the Water Corporation does not find itself in any difficult legal battles.

Richard,

DRAFT WEST PILBARA WATER RESOURCES REVIEW

Thank you for providing DRD with a copy of the above report. The report contains valuable information regarding water resources in the West Pilbara, their relative costs and development strategies.

1. I have some further comments regarding the report which includes feedback from John Prior. As outlined in my memo of the 30 January 1995 to P. Goodall, the water demand scenarios are very sensitive to Mineralogy's Fortescue Magnetite Project. Graph 2 in the draft report, showing historical and future water demand illustrates the large differences between the low and medium growth scenarios due to Mineralogy's project. The latest advice from Mineralogy is that it will supply its own water from desalination.

   In light of the above information, DRD considers that the high and medium water demands should be reduced by an amount which approximates Mineralogy's project water demand i.e. 15 Mm^3 pa. The water demand scenario would therefore be;

Low	8 Mm^3 pa
Medium	15 Mm^3 pa
High	30 Mm^3 pa

   As discussed with you this morning the lower water demand scenarios favour groundwater sources. Therefore further economic costing would be appropriate when more accurate information on water treatment/hydrological for the Harding Dam/Millstream water resource is available.

2. Comments on WAWA's ability to fulfil its current water supply commitments as covered in specific State Agreements and the consequential impact on extra demand would be useful information.

3. Include some preliminary estimates on lead times to develop the water resources described in the draft report i.e. design, approval, construction.

4. A schematic plan for the Pilbara water supply reticulation scheme showing capacities in each section , and upgrades required to achieve design yields, would be useful.

5. Could the report include a table showing upfront capital cost and operating costs (assuming maximum utilisation of the water resource) for each water resource.

6. The water demand split between the proposed Maitland Estate, the Burrup Peninsula and Cape Lambert appears biased to the Maitland Estate. Could the report either re-assess the water demand split (40%, 40%, 20% respectively) or include a statement qualifying the relative costs of supply to each area.

7. Does WAWA have any restrictions on the distribution of the report.

I hope the above comments on the draft report are useful and broaden its potential use.

Yours sincerely

Paul Platt

Dear Mr Goodall

RE: WEST PILBARA WATER SUPPLY REVIEW

In regard to the above, I have reviewed the water consumption figures in your letter of 13 January 1995 for various growth scenarios.

The revised industry growth scenarios proposed for the Pilbara area with corresponding water consumption figures are shown in Table 1 below. The estimated water consumption figures are ±20% depending on which projects proceed. The medium growth scenario is sensitive to the Fortesque magnetite mining and primary processing project and will need to be reviewed as more information is available.

TABLE 1: GROWTH SCENARIOS

GROWTH SCENARIO	WATER CONSUMPTION (Mm^3 pa by 2025)
Low	8
Medium	30
High	43

The growth scenarios are based on the number and type of industry processing projects outlined in Appendix 1 and Appendix 2. The water demand assumptions for each industry type and process is shown in Appendix 3.

If you have any queries please contact me on 327 5936.

Paul Platt

Enc

Appendix 1 : Growth Scenarios

Low Growth Scenario

Industry	Comments	Water Consumption (Mm^3 p.a.)
Iron Ore Processing	Only a few industries go ahead.	4
Petroleum Processing	Only a few industries go ahead.	3
Power Intensive Industry	Only one of the industries goes ahead.	1
Total		**8**

Medium Growth Scenario

Industry	Comments	Water Consumption (Mm^3 p.a.)
Iron Ore Processing	Many of the industries go ahead.	20
Petroleum Processing	Most of the industries go ahead.	7
Power Intensive Industry	A few of the industries go ahead.	3
Total		**30**

High Growth Scenario

Industry	Comments	Water Consumption (Mm^3 p.a.)
Iron Ore Processing	Vertical Integration and horizontal expansion of the industry.	28
Petroleum Processing	Most of the industries go ahead.	9
Power Intensive Industry	Most of the industries go ahead.	6
Total		**43**

Notes to accompany Appendix 1,Appendix 2 and Appendix 3:

1. Water consumption figures include domestic as well as industrial.

2. Assume seawater is used as a cooling water and for some primary ore processing.

3. Water consumption figures very sensitive to Fortescue magnatite primary processing project.

4. The key feedstocks of iron ore, natural gas and salt are available at (or in close poroximity to Karratha, Cape Lambert and Port Hedland. Karratha/Cape Lambert may be more attractive for Petrochemicals, being closer to the current source of natural gas.

5. Workforce numbers indicative only. Actual numbers will vary dependant upon process technology, product line, shift arrangements etc.

6. No committments have been made to construct projects.

Low	3
Medium	10
High	27

PROJECTED WATER DEMANDS

Growth Rate	2025 Water Demand (GL pa)	Average Day Peak Week (ML/d)
-	Currently 6.6	Currently 28
Low	10	45
Medium	17	80
High	34	160

B.1 POTENTIAL INDUSTRIAL DEVELOPMENT

Three broad categories of industry that could be developed in the East Pilbara (Port Hedland) area have been identified, namely:

- downstream iron ore processing;
- downstream petroleum (gas) processing; and
- power intensive industries.

Growth scenarios for these industries for the thirty year period 1995 to 2025 have been estimated based upon discussions with Peter Goodall of the Water and Rivers Commission.

B.2 DOWNSTREAM IRON ORE PROCESSING

Estimated low, medium and high growth scenarios for projects incorporating the iron ore processing industry are given in Table B-1.

TABLE B-1
DOWNSTREAM IRON ORE PROCESSING PROJECTS
GROWTH SCENARIOS 1995 to 2025

Project Type	Growth Scenario		
	Low	Medium	High
Primary Processing	0	0	1
Pelletised Iron	0	1	2
Sintered Iron	0	1	1
Direct Reduced Iron/HBI	1	1	1
Mini Steel Mill	0	0	1

Using total estimated potable water demands for downstream iron ore processing projects (Public Works Department, 1981) the range of water demands can be defined as presented in Table B-2.

TABLE B-2

DOWNSTREAM IRON ORE PROCESSING PROJECTS
ESTIMATED WATER DEMANDS (GL pa)

Project Type	Low Growth		Medium Growth		High Growth	
	Industrial	Domestic	Industrial	Domestic	Industrial	Domestic
Primary Processing	-	-	-	-	7.0	0.13
Pelletised Iron	-	-	1.6	0.12	3.2	0.24
Sintered Iron	-	-	2.6	0.12	2.6	0.12
Direct Reduced Iron/HBI	2.6	0.16	2.6	0.16	2.6	0.16
Mini Steel Mill	-	-	-	-	0.5	0.52
	2.6	0.16	6.8	0.40	15.9	1.17
	2.8		7.2		17.1	

B.3 DOWNSTREAM PETROLEUM PROCESSING

Raw materials for the downstream petroleum processing industry typically include natural gas and water. As natural gas would be supplied by pipeline from the Dampier/Karratha area, downstream petroleum processing industries are more likely to be established in this area than in the Port Hedland area. As such, it is concluded that growth of the downstream petroleum processing industry in the Port Hedland area is not likely.

The adopted potable water demands for the downstream petroleum processing industry for the thirty year period 1995 to 2025, are given in Table B-3.

TABLE B-3

DOWNSTREAM PETROLEUM PROCESSING PROJECTS
ESTIMATED WATER DEMANDS

Growth Scenario	2025 Water Demand (GL pa)
Low	0
Medium	1
High	4

B.4 POWER INTENSIVE INDUSTRIES

As with the downstream petroleum processing industry, natural gas (power) which is an essential raw material for the power intensive industries would be supplied by pipeline from the Dampier/Karratha area. Although depending upon the availability of other raw materials, the power intensive industries are also more likely to be established in the Dampier/Karratha area than in the Port Hedland area.

The adopted potable water demands for the power intensive industries, for the thirty year period 1995 to 2025, are given in Table B-4.

TABLE B-4

POWER INTENSIVE INDUSTRIES
ESTIMATED WATER DEMANDS

Growth Scenario	2025 Water Demand (GL pa)
Low	0
Medium	1
High	3
